ATKINS

SILVER STEEL SAWS

It Pays to Buy Better Tools!

THERE'S a "feel"—a balance—a difference—about ATKINS "Four Hundred" Hand Saw that will make it YOUR favorite saw—always. "Silver Steel" makes it hold its edge longer. "Taper Grinding" makes it cut surer, faster and easier. It's the very best saw even ATKINS can make. Really saves you money—outlasts two or three "cheap" saws. Ask your hardware dealer about it.

Two Saw Booklets FREE

Send for helpful booklets on ATKINS Saws and their use—"Saws in the Home", or "Saw Sense." Sent you FREE. Address Dept. P.

Be President of Your Own Company

Nestler Licensees earning \$4,000 to \$15,000 annually — get into this growing business now.

WE would like to tell every man who wants a profitable business in his own name the full facts concerning the amazing Nestler Rubber Fusing Process. Only a bare outline can be given here. In 1839 Goodyear discovered the process of vulcanization. Vulcanization made pneumatic tires possible. Since 1839 vulcanization has been an irreversible process. This is the real reason why the servicing of pneumatic tires has been so unreliable and uncertain in the past and why tire retreading has been a commercial impossibility.

In 1917, Emil Nestler, an officer of this company, discovered a method of de-vulcanizing the rubber on a pneumatic tire without removing it from the tire. Because of this discovery, it then became possible to join new rubber to old so that an actual fusion or welding of the two took place. It welds rubber to rubber like steel is welded to steel with the electric arc.

Enormous Market

There are now more than 17 million automobiles in the United States, each of which have four tires. Every year more than half this number of tires—more than 34 million tires—are junked merely because part of the rubber has worn off the treads. A large proportion of these tires could be made to do **DOUBLE DUTY!** A new, tough

durable rubber tread could be fused or welded to these worn tires by the Nestler Rubber Fusing Process. They would look and wear like new. Car owners would cut their tire costs squarely in half.

The Nestler Rubber Fusing Process was patented in 1920 and since then, has been in actual use. Hundreds of thousands of tires Nestlerized have demonstrated the soundness of the Nestler Process beyond all argument. In addition to retreading, the Nestler Process also makes possible tire repairs that literally outlast the tire.

Think of the opportunity for a Nestler Rubber Fusing Station in your community! Previous experience is unnecessary. Only moderate capital required and there is a big profit in each tire you do. Earnings of \$4,000 to \$15,000 and more annually now being made.

No Experience Necessary

The Nestler Rubber Fusing Process is not complicated—it is simple. It is not costly—it is cheap. It is not slow—it is fast. Nestler Steamless Equipment is not costly—it is moderately priced. Any man of average intelligence can master the Nestler Rubber Fusing Process in a few days' time. Free instruction either in our demonstration schools or by mail is given to all licensees. A new plan makes it possible to *earn while you learn*. Nestler licensees are glad to say that Nestler Cooperation has been one of their biggest assets.

FREE BOOKS

We have printed two books. One describes the Nestler Opportunity; the other describes the Nestler Process in detail. They give **FACTS!** We will gladly send them without obligation to any man who is interested in the possibilities in a proven, new, uncrowded field, to build a large business with splendid profits. Because of the demand due to present unusually favorable conditions you are urged not to delay. Mail the coupon today.

Nestler Rubber Fusing Co., Inc.
Dept. P7, 245 W. 55th St., New York

Emil Nestler, the inventor of the Nestler Rubber Fusing Process, demonstrates one of the seven simple steps in Nestlerizing a tire.

"New Tires from Old"

That is the Nestler proposition in a nut shell. The worn tread is replaced with a new tread. The new tread and the tire become as one. It will look and wear like new. You can guarantee it. No other process or method will produce the same results.

Nestler Licensees Say

From \$780 Year Store to \$8200 Building in One Year

"In a little more than a year we have built up the largest tire service in this city without any previous tire experience. From a \$65 a month shop where we started we have just taken an \$8200 a year building to take care of steadily increasing demand."

DOUBLES BUSINESS

"In the first three months we have been using the Nestler Process and equipment we have more than doubled our business. Working conditions have been greatly improved."

TIRES GIVE SATISFACTION

"In the past year I have retreaded hundreds of passenger car, truck and business car tires. The mileage delivered was more than sufficient to make customers mighty pleased with the service."

WORKING 14 HOURS A DAY!

"I am working my plant 14 hours a day and all my work is engaged days ahead."

NESTLER RUBBER FUSING CO., INC.,
Dept. P7, 245 W. 55th St., New York.

I am interested in your proposition. Send me your two free books today.

Friendly but Friendless

SICK at heart he watched them go. Last year he was always asked to join this merry group, but now the invitations were becoming fewer and fewer. He touched his face gingerly in miserable speculation. Could it be . . . ?

* * *

A great many young men are inclined to have a grimy-looking skin spotted with blackheads and dull in appearance. Few realize that this hinders their success in life. Pompeian Massage Cream helps you overcome this handicap by giving you a clear, ruddy complexion.

Cleaves the Skin: Pompeian Massage Cream thoroughly cleanses the pores. It helps clear up blackheads and pimples by stimulating healthy circulation, and by keeping the skin clean and the pores open.

Easy to Use: After shaving or washing, rub the cream in gently. Continue rubbing and it rolls out, bringing with it all the dirt, grime, and skin impurities. Result—a clean, healthy skin.

* * *

Use Pompeian Massage Cream regularly at home—then you'll get the full benefit. At all druggists.

SPECIAL INTRODUCTORY OFFER

1/3 of 60c jar for 10c

For 10c we send a special Trial Jar containing one-third of regular 60c contents. Contains sufficient Pompeian Massage Cream to test thoroughly its wonderful benefits. Positively only one jar sent to a family on this exceptional offer.

The Pompeian Co., Cleveland, O., Dept. 80
Gentlemen: I enclose a dime (10c) for 1/3 of a 60c jar of Pompeian Massage Cream.

These LaSalle-Trained Men Have Helped My Business Grow!

—Marshall A. Smith

Above—C. E. Veth
Traffic Manager

Below—I. A. Gould
Manager of Sales
for Michigan

Marshall A. Smith, Pres.

Columbus Plant
Smith Agricultural Chemical Company
Indianapolis, Ind. Columbus, Ohio

Why I. A. Gould Received Two "Raises" and C. E. Veth a Salary-increase of 200%

FROM the great plants of the Smith Agricultural Chemical Company, at Columbus and Indianapolis, thousands of tons of fertilizer, animal foods and acids—under the brand name Sacco—are shipped to all parts of the United States.

I. A. Gould, a salesman for this organization, had been a farmer in Central Michigan. At the age of 48 he entered upon a new vocation—enrolling at the same time for LaSalle training in Modern Salesmanship. Within three years he had topped the list in Michigan and had been given entire charge of sales in that state, with a crew of men under his direction. In July, 1925, he writes, "I have increased my sales this past season 50 per cent, and my salary has been raised twice since last October."

C. E. Veth, Traffic Manager for this company, saw the need for a properly equipped traffic department—this as a result of LaSalle training in Traffic Management. So successfully did he put it into

operation that during the year 1924 errors in freight bills totalling \$10,600 in overcharges were detected and corrected. To LaSalle, in large measure, he credits a salary-increase of 200 per cent.

"We can only attribute the rapid success of these two men," writes Marshall A. Smith, head of this great organization, "to their energy and initiative, together with the practical knowledge gained thru the pursuit of LaSalle training."

Send for Free Copy "Ten Years' Promotion in One"

The men who have made such gratifying progress took first a simple step—they sent for a free book, "Ten Years' Promotion in One," the book that has started thousands and thousands of men on the path to responsibility and power.

A copy of this book is yours for the asking—and with it a 64-page book outlining in detail the opportunities in the business field that most appeals to you. You have often thought that you would send for full particulars of the LaSalle Salary-Doubling Plan. This time—for the sake of a brighter future—ACT!

in
ONLY 2 months

The
BEST
training
in the
BEST
line
brings
QUICKEST
and
BIGGEST
RESULTS

Get my FREE Book. I give you
\$10,000 lesson on the word
QUICK!

"Quick" IS THE VITAL WORD

To make \$1000 SLOW in say 5 years means FAILURE. To make \$1000 QUICK in a month means SUCCESS. QUICK is the dominating, all important word that is the Father of the word SUCCESS. Get My QUICK training. Of course my Training includes ALL ELECTRICAL, ALL MECHANICAL—WELDING, BRAZING, VULCANIZING—it's complete. Of course, I give you LIFE-TIME CONSULTATION SERVICE and my students say it's wonderful—but on top of all this, I give you a valuable Business Course—Salesmanship, Advertising, Book-keeping, Buying—everything. The best of Auto Engineers on my Pay Roll help me to help you, with backing of Auto Industry makes all this possible.

Go Into Business

My Free Book, AUTO FACTS, shows how I've put man after man in the Auto business for himself—QUICK—just a few weeks after enrolling! Amazing rewards are everywhere for men TRAINED MY WAY, to be their own Bosses—own their own Shops. Very little capital needed to start.

One Million Auto Experts BADLY NEEDED

Over a million trained men are needed it is rated to replace "thinkers" and untrained "guessers." Farms, Villages, Cities offer BIG MONEY opportunities QUICK. Stay Home. Keep your job—I'll show you the way to follow your present pay right away, in the earliest weeks of your training. Hundreds virtually get my training for nothing! See all this in my Big Book.

I Help You to GOOD JOBS

ALL YOUR LIFE, this Great Auto Institution, backs you up with Employment Service as often and as long as you want it absolutely at no extra cost. My fine Automotive Magazine "POPULAR AUTOMOTIVE NEWS" is also sent you free of extra cost. Free book tells all.

Action makes dreams come true, QUICK!

Get My Free Book. I Train You in Your Spare Time, At Home

When you look at training—look for its Quick Results. Good training are also my QUICK RESULTS. Act quick and I'll send you Free, my remarkable book, "Auto Facts." See how in 3, 6, 10 and 15 weeks many students' earnings jump. Judge as your good judgment tells you. BUT ACT!

Former Bricklayer Now Earning \$12,000 a Year

"When I enrolled with the International Correspondence Schools, I was a bricklayer and I didn't know a thing about blueprints. Today I have my own contracting business and I am able to figure and execute the most difficult jobs. My income is between \$12,000 and \$15,000 a year. It certainly was a lucky day for me when I sent in that I. C. S. coupon."

THAT'S a true story of what just one student of the International Correspondence Schools has done. There are thousands of others. Every mail brings letters from men and women telling of increases in income and salary due directly to spare-time study.

A recent investigation of 13,298 students enrolled in I. C. S. Building Trades Courses showed that

1291 had become Architects, 246 had become Designers, 494 had become Chief Draftsmen, 2827 had become Draftsmen, 1845 had become Contractors, 211 had become Assistant Foremen, 4030 had become Foremen, 2354 had become Superintendents.

In every instance these students reported salaries or independent incomes far greater than when they took up their studies. Many have shown increases of 300% to 500%. Some have incomes as high as \$25,000 per year.

The Equitable Building, New York, largest office-building in the world, was erected under the direction of I. C. S. Student H. S. Gardner, then Superintendent of Construction for the Thompson-Starrett Company.

The Classical High School, Lynn, Mass., was built by I. C. S. Student George H. Stowe.

The Kansas State Memorial Building, Topeka, was designed and erected by I. C. S. Student C. H. Chandler, then State Architect of Kansas.

The Pacific Building, San Francisco, largest reinforced concrete building in the world at the time of its erection, was built under the direction of I. C. S. Student Erik Holman.

George A. Griebble, who was a stone-mason by trade, decided to win success in construction work and took up an I. C. S. Course. Today he is a member of the Griebble Company, Cleveland, earning \$12,000 a year. In one year his firm erected buildings valued at \$6,000,000.

You too can have the position you want in the work you like best, an income that will give you and your family the home, the comforts, the luxuries you would like them to have. No matter what your age,

your occupation, or your means, you can do it!

All we ask is the chance to prove it. That's fair, isn't it? Then mark the work you would like best in the coupon below and mail it today. There is no obligation and not a penny of cost, but it may be the means of changing your entire life. Do it now!

-and Will Pay Big Money *TO DARING YOUNG MEN*

AVIATION—the sensation of the century—has jumped into the spotlight of world prominence. History has never recorded such amazing developments as have taken place in the past year. Gigantic new projects have been started. America's biggest fortunes are behind them. Financial wizards like Henry Ford are investing millions in establishing air-ways and airplane factories. A sudden new demand for daring and trained young men in aviation has developed almost overnight. The boom is on—and it spells O-P-P-O-R-T-U-N-I-T-Y in glowing letters a mile high for every young man. Qualify NOW for One of These Exciting Jobs That Will Pay \$4,000 to \$10,000 a Year!

Opportunities The World Has Never Seen Before

Experts say Aviation will develop more astonishingly than the automobile industry. It is backed by big money, power and influence, but right now it lacks just one thing: TRAINED MEN with vision. Think of the jobs that will pay \$300 to \$800 a month and possibly more in a new and growing industry. It is almost incredible! Yet that is the situation that Aviation faces in the near future unless trained men can be found.

Easy To Become Aviation Expert

Now, by a unique system of basic training—evolved to help the industry cope with its need for trained aviation experts—we offer you a chance to qualify for one of these big-paying Aviation jobs. And best of all, you train at home without leaving your present occupation. The method of preparation is simple and easy and the study of Aviation, as we present it, is almost as fascinating as the work itself. You get personal instruction by experts. Every lesson is packed full of interest. You become so interested that you forget that you are working to prepare for big things—it seems more like a game. And only one hour a day will give you the necessary basic training in an amazingly short time.

Get Ready For One Of These POSITIONS

Aeronautical Instructor \$60 to \$150 per week
Aeronautical Engineer \$100 to \$300 per week
Aeronautical Contractor Enormous Profits
Aeroplane Repairman \$60 to \$75 per week
Aeroplane Mechanician \$40 to \$60 per week
Aeroplane Inspector \$50 to \$70 per week
Aeroplane Salesman \$5,000 per year and up
Aeroplane Assembler \$40 to \$65 per week
Aeroplane Builder \$75 to \$200 per week

Get Started Now

Get into Aviation at once while it is still in its infancy and the big money is yet to be made. Let nothing stand in your way! Big pay, success and popularity will await the man who qualifies now. Don't wait and see others realize their ambitions while you tremble on the brink of hesitation. Opportunity comes but once to every man. Seize your chance!

Send For FREE BOOK

Right now we offer you a copy of our Free book, "Opportunities in the Airplane Industry." It will open your eyes to facts you never dreamed of; you owe it to yourself to at

least read it. Get your copy now. No obligation. Mail the coupon tonight!

Just off the press. Special limited edition. Get yours immediately and avoid disappointment.

Learn Electricity in 12 weeks at Coyne

*Students Doing Actual Work On
Power Transmission Apparatus*

*Students Working on Massive
A. C. Control Equipment.*

*Students Practicing House-wiring
In Skeleton Houses*

**Earn \$65 to \$200 a Week!
Or Go In Business for
Yourself and Make \$3500
to \$15,000 a Year!**

Yes, 12 weeks at the Great School of Coyne, located in Chicago, The Electrical Center of the World, will enable you to become an Electrical Expert capable of commanding big pay. The whole world of electricity is open to the practical man—the man who has had actual experience with electrical apparatus. Coyne gives you a practical training on the greatest outlay of electrical apparatus of any institution in the World, everything from door bells to power plants.

You Can Become an Electrical Expert

We don't attempt to teach you by lessons or books. We train you by practice on our mammoth outlay of actual equipment. We train you in house-wiring by having you do it exactly as it is done outside—not just by reading about it. The same applies to armature winding, power plant operating, motor installations, automotive work and hundreds of other electrical jobs. That's why we can train you to become a Master Electrical Expert.

No Books—No Lessons—You Do Actual Work

The Coyne practical course includes no books, printed lessons or useless theory. We train you to work with your head and hands on the same kind of electrical apparatus as you will find "out in the field". Age, lack of experience or education is no drawback. Our students range from 16 to 60 years of age. Coyne gives you Free a Life Scholarship which enables you to stay as long as you want without extra charge or return later for more training, and assists you to a position after graduation. We also include Free a course in radio and auto electricity, and pay your railroad fare to Chicago.

Earn While You Learn!

We help students to secure jobs to earn a good part of their living expenses while training and assist them to a big paying job on graduation.

Send For Free Book

Send for the Big Free Book which shows the Great School of Coyne and a great part of our massive electrical equipment. You will be convinced that the place to get a practical electrical training is in the Great School of Coyne.

3 ELECTRICAL LESSONS

actually FREE!

Training Built by 23 Noted Engineers

This is not a one-man, one-idea school. 22 famous Engineers and Executives of the following corporations and universities helped me make Dunlap-training complete and up-to-date.

1. General Electric Co.
2. Commonwealth Edison
3. Crocker-Wheeler Co.
4. Cutler-Hammer
5. American Tel. & Tel. Co.
6. Westingh. El. & Mfg. Co.
7. Western Electric Co.
8. Underwriters Lab., Inc.
9. Columbia University
10. Dartmouth College
11. Massachusetts Inst.
12. Lehigh University
13. University of Vermont

AND MANY OTHERS

to prove this home-training will prepare you for a good job and a raise in pay!

Get these three lessons. Look them over. Test your own ability to master Electricity at home in spare time. See for yourself how every fact has been simplified. See what thousands of men have paid millions of dollars for, to help them earn **BIGGER PAY**. Uncover some of the mysteries of Electricity, and see why millions of men are so fascinated by it. Don't send a penny, don't enroll—just mail the coupon.

Go Into ELECTRICITY!

Thousands of jobs open at \$60 to \$125 a week. My training prepares you to fill them. Superintendents of Power Plants Wanted. Chief Electricians Wanted. Electrical Experts Wanted in Radio, Electrical factories, Auto Plants, Telephone and Telegraph Systems, etc.

I Will make this Contract with You!

Read it. This million dollar institution stands back of this agreement to **PREPARE** you to fill a well-paid Electrical Job, and then to help you **FIND** the job—or to refund the small amount charged for your training!

4 Costly Electrical Outfits Given!

I send you absolutely without extra cost, as a part of this training,

4 costly outfits of standard size tools and materials, so you learn Electricity BY **DOING** actual Electrical jobs. One of these outfits is a \$10 Electric Motor—a real motor and generator, the same type as the big fellows in a power plant. I send it to you "knockdown" and have you wind the field and armature and assemble it. *That's the way I teach every branch of Electricity!* House-wiring, Electric Light, Radio, and Motor outfits included.

\$10 Motor Given

Your name here.....
When you enroll for my home-training in **ELECTRICITY** I agree to give you:

1. Complete training, including Electrical Engineering, Ignition; Radio, etc.
2. Four outfits of standard tools and materials, including a \$10 motor.
3. I WILL HELP YOU GET A GOOD JOB AND A RAISE IN PAY.
4. —or I will refund every cent of your money.

By *Chief Engineer Dunlap*

Name

St. No.

City.....State.....

EARLE E. LIEDERMAN, *The Muscle Builder*
Author of "Science of Wrestling," "Muscle Building," "Secrets of Strength," "Here's Health," etc.

If You Were Dying To-night

and I offered something that would give you ten years more to live, would you take it? You'd grab it. Well, fellows, I've got it, but don't wait till you're dying or it won't do you a bit of good. It will then be too late. Right now is the time. Tomorrow or any day, some disease will get you and if you have not equipped yourself to fight it off, you're gone. I don't claim to cure disease. I am not a medical doctor, but I'll put you in such condition that the doctor will starve to death waiting for you to take sick. Can you imagine a mosquito trying to bite a brick wall? A fine chance.

A RE-BUILT MAN

I like to get the weak ones. I delight in getting hold of a man who has been turned down as hopeless by others. It's easy enough to finish a task that's more than half done. But give me the weak, sickly chap and watch him grow stronger. That's what I like. It's fun to me because I know I can do it and I like to give the other fellow the laugh. I don't just give you a veneer of muscle that looks good to others. I work on you both inside and out. I not only put big, massive arms and legs on you, but I build up those inner muscles that surround your vital organs. The kind that give you real pep and energy, the kind that fire you with ambition and the courage to tackle anything set before you.

All I Ask Is Ninety Days

Who says it takes years to get in shape? Show me the man who makes any such claims and I'll make him eat his words. I'll put one full inch on your arm in just 30 days. Yes, and two full inches on your chest in the same length of time. Meanwhile, I'm putting life and pep into your old back-bone. And from then on, just watch 'em grow. At the end of thirty days you won't know yourself. Your whole body will take on an entirely different appearance. But you've only started. Now comes the real work. I've only built my foundation. I want just 60 days more (90 in all) and you'll make those friends of yours who think they're strong look like something the cat dragged in.

A Real Man

When I'm through with you you're a real man. The kind that can prove it. You will be able to do things you had thought impossible. And the beauty of it is you keep on going. Your deep, full chest breathes in rich, pure air, stimulating your blood and making you just bubble over with vim and vitality. Your huge square shoulders and your massive muscular arms have that craving for the exercise of a regular he-man. You have the flash to your eye and the pep to your step that will make you admired and sought after in both the business and social world.

This is no idle prattle, fellows. If you doubt me, make me prove it. Go ahead, I like it. I have already done this for thousands of others and my records are unchallenged. What I have done for them, I will do for you. Come then, for time flies and every day counts. Let this very day be the beginning of new life to you.

Send For My New
64 Page Book

"Muscular Development"

IT IS FREE

It contains over four dozen full-page photographs of myself and some of the many prize-winning pupils I have trained. Some of these came to me as pitiful weaklings, imploring me to help them. Look them over now and you will marvel at their present physiques. This book will prove an impetus and a real inspiration to you. It will thrill you through and through. And it's all yours. I don't ask a cent. This will not obligate you at all, but for the sake of your future health and happiness do not put it off. Send today—right now before you turn this page.

Students learning to make bridges, plates, etc., for dentists

Dental Laboratory Work Offers You This Money-Making Opportunity

Six months pass quickly—and \$6,000 a year is a lot of money. Many laboratory owners earn more. McCarrie trained experts rise rapidly to the class of big pay men. It's easy to establish your own laboratory after you have received our thorough training. No educational requirements are necessary to enroll. No mechanical experience needed. No text books—no home study—no classes—no lectures! Easy to learn. Never before has the man of moderate circumstances been offered such an opportunity.

Go Into Business For Yourself After 6 Months of Training

About 6 months of training in one of our schools will prepare you to open your own laboratory and enjoy the dignity and the big income of this profession.

Many newly established dental laboratories do a business of \$100 to \$200 weekly. Two of our graduates reported that they earned over \$12,000 last year. Many other successful cases on file in this office.

Besides our practical and personal instruction in making bridges, plates, crowns, etc., for dentists, we assist you in securing a location and equipping your laboratory. We train you also in laboratory management and operation.

Thousands of Dental Laboratories are Needed—Uncrowded Field—Growing Business

Do you know that Dental Laboratories are service stations for dentists? Do you know that modern dentists are too busy to make bridges, plates, crowns, etc., and that they send this work to trained laboratory experts? There are 70,000 dentists in the U. S. and Canada. More are being graduated each year. There is a shortage of thousands of dental laboratories today and a great shortage of trained laboratory experts.

Big Demand for Mechanical Dentists

Progressive laboratories always need good men. We continually receive letters from McCarrie graduates who own laboratories, calling for more men. Prominent dentists endorse the McCarrie schools and employ our graduates in their private laboratories. Experts make big money—as high as \$125 a week.

McCARRIE SCHOOLS OF MECHANICAL DENTISTRY
1338 SOUTH MICHIGAN AVENUE
Dept. 19 CHICAGO, ILL.

In the McCarrie course, you learn by doing. No books or classes! Actual training with precious metals and tools will enable you to make bridges, crowns, plates, and do other dental laboratory jobs. McCarrie trains by short cuts—by teaching you to do the actual jobs. This practical method of training by doing, has made it possible for McCarrie students to finish their training in four, five or six months.

Free R. R. Fare To Chicago, Detroit, Cleveland, Philadelphia, Boston

We will pay your railroad fare to the school nearest your home—without a penny increase in tuition. We will also help you find a moderately priced place to live and we will help you obtain a spare time job so that you can earn while learning and enjoy the recreation of sight-seeing in one of our school towns.

Free Book

Mail coupon for fascinating book on dental "lab" work. Learn how others have succeeded—how you can gain financial independence.

Louis Ottely, D.D.S., M.D.
Educational Director
McCarrie Schools

Graduate of Western College of Dental Surgery, St. Louis, in 1879. Member of Local, State and Am. Dent. Ass'n. Former Pres. Chicago Dental Society. Dean of Am. College of Dental Surgery, 1893-6. Major, Dental Corps, U. S. Army, 1918. Drafted various dental laws. Qualified by years of experience and service in dentistry to direct the education of our students and assist our graduates.

for Men Who Read This Ad

Let Me Make You a Master Salesman! This New Easy Way

I DON'T care what you are now or what you think. The Association of which I am president will take you in short, easy steps and make a Master Salesman of you, put you in the same class with the big pay men who have all the good things of life.

Many have thought that Salesmen were "born." And that idea has kept many men from succeeding. But this Association of Master Salesmen has proved that any man can be taught the rules and principles that make men Master Salesmen. And you know as well as I do that Salesmen top the list of money-makers. They are the producers and you can be one of them.

Easy as A, B, C

If you are as intelligent as the ordinary mechanic, postal clerk or stenographer, you can quickly master the simple A, B, C's of Selling. There are certain ways of approaching a prospect to get his undivided attention, certain ways to stimulate keen interest, certain ways to overcome objection, batter down prejudices, outwit competition and make the prospect act.

You can learn these principles at home in a short period of pleasant, inspiring study. And once you have mastered these secrets of Master Salesmanship, you can take advantage of the employment department of the Association without charge. They will help you select and secure a position as soon as you are qualified and ready.

This is a real opportunity, for during the last year the Association received calls for 49,880 salesmen from many of the leading sales organizations in America. And these men are the same as you see above—men who make from \$5,000 to \$10,000 a year in salary and commission.

These are only four out of hundreds of similar records in the Association files. Our members make good because the Association has specialized for eighteen years in teaching the Art and Science of Salesmanship and teaches the most unusual principles ever laid down for quick success.

The book you see below has been the starting point for thousands of men who are now successful salesmen. This book, "Modern Salesmanship," is now FREE.

Rush the Coupon

If I were asking ten or twenty dollars for this book you might hesitate. But I am not. It is Free. And since it may mean the turning point in your life, when you leave forever behind you the drudgery and low pay of routine work for the fascinating, big pay job of the salesman, it certainly is worth your time and the two cents you will have to spend to get this amazing book and read for yourself the astonishing facts given between its two covers. You have everything to gain and not one cent to lose, so mail the coupon today, sure.

"They've tripled your salary, dear"

"I TELL you, Tom, it was a lucky day for both of us when you sent in that I. C. S. coupon. You'd never be where you are today if you hadn't decided to study in spare time just when you did."

Spare-time study with the I. C. S. is winning promotions for thousands of men and bringing happiness to thousands of homes all over the world. In offices, shops, stores, mines, mills and on railroads, I. C. S. trained men are stepping up to big jobs, over the heads of older men, past those whose only qualification is long service. There is a job ahead of YOU. Some man is going to be picked for it. The boss can't take chances. He is going to choose a trained man with sound, practical knowledge of the work.

Get busy right now and put yourself in line for that promotion. You can do it in spare time in your own home through the International Correspondence Schools, just as thousands of other men and women have done.

DRAFTING PAYS BEST!

**Beginners Earn \$50 and \$65 a Week or More!
Junior Draftsmen \$400 a Month; Chiefs, \$800**

There's *big* money in drafting. Make no mistake about that! My former students are getting all the way from \$250 a month as juniors, to \$833 a month as chiefs.

Here is your chance to take up drafting. Learn practical draftsmanship at home—but under the daily direction of Chief Draftsman Dobe—the man who has made finished draftsmen of thousands of men, young and old—men who had no previous training, or even the average amount of schooling. Give him your evenings for just a few months, and you'll be ready for almost any drafting job that offers. Begin in time to get all your tools without a dollar's extra outlay! Note offer:

Money-Making Tools

A Professional Drafting Set, and All Supplies Furnished!

"My new chief says, Dobe must teach right; I can handle everything so far. They pay me \$65 a week."—LEO NISCHBERGER (Pa.)

"Just been made chief and got a good boost in pay. Your course has the goods."—Wm. G. HASLET (Cal.)

Scores of engineering firms and manufacturers recruit their draftsmen from my classes. I haven't enough men now—and a busier season is coming. Therefore, I make this offer to get *action*: a beautiful set of imported drafting instruments, all rules and tools, and a *drafting table*, free of any extra expense to those who join up at once. You needn't decide now, but get your name in at once for this free offer! Clip coupon, and *mail it!* I want to caution you that this is a limited offer—it isn't one I can afford to keep on making!

WHY DRAFTING PAYS It's in the drafting room that the big ideas come—and the big money. Have you ever known a draftsman who didn't like his work? Or one who ever had to look for work? If a hundred dollars a week sounds big—yes, or \$150—you aren't in the right line of business! Get into a broader field—the broadest of all. That's drafting. Investigate the tremendous field of drafting before you decide on any line of work or career. Drafting fits in with almost any kind of work you can think of.

IN 1926 I predict a shortage in draftsmen. Last Spring, every sort of inducement was being offered men who could draft. Scores of our "boys" stepped right into fine jobs the week they had completed our course. This year will see still greater demand for draftsmen—with a big building boom and big production all over U. S. and abroad.

Every Industry Is Calling for Draftsmen

Above Drawing by a Two-Month Dobe Student

PAYING POSITIONS loom up almost as soon as you are enrolled in a Dobe class! We receive requests *daily* for junior men—for men only partly through our course. "We'll take a *beginner*," some concerns write us, "so long as he is a Dobe trained man and has begun *right!*" Furthermore, a lot of our students are willing to carry on special work for pay, right while their lessons go on.

But why try to tell you here, all the wonderful facts you'll find in my new, big book, *Successful Draftsmanship*? Full of actual information, fully illustrated, the biggest and most fascinating book ever published on the subject! Send for it in time to get your complete, lifetime drafting outfit *free* of any extra cost whatever! Coupon below.

I Can Teach You to Sing Like This!

I do not mean I can make a Caruso out of every man, or a Mary Garden of every woman—BUT I can teach you in a few short months a basic secret of voice development which Caruso discovered only after years of persistent effort.

Here is the secret! Biographers of the great Caruso tell us of his wonderful tongue control. Caruso himself speaks of it as the secret of vocal power and beauty. But tongue control depends entirely on the hyo-glossus muscle (shown in the illustration). Professor Feuchtinger has discovered the way to isolate and develop this muscle. You can benefit by his system of simple silent exercises, and do in a few months what it took Caruso years to accomplish.

If you are ambitious to sing, speak, or merely improve your voice, here is your opportunity. If you suffer from stammering, stuttering, or any vocal defect, here is a scientific method of relief. The course is ideally adapted to correspondence instruction. You can practice in the privacy of your own home.

100% Improvement Guaranteed

Thousands have already received the benefits of the "Perfect Voice" method. You can do it, too. If your voice is not doubled in power and beauty, your money will be refunded.

Free Book Send today for the Professor's book on voice production. It will open your eyes to the possibilities of your own voice.

Perfect Voice Institute

1922 Sunnyside Ave., Studio B-135, Chicago
Please send me FREE Professor Feuchtinger's book, "Enter Your World." I have put X opposite the subject that interests me most. I assume no obligation whatever.

Be a Building Engineer

Make \$5,000 to
\$20,000 a Year

*Learn at home
in spare time*

WHY? Why does the Building Contractor make as much in a day as You do in a week? And he doesn't work half as hard, either. What's the Construction Superintendent got, that you *haven't*? How are you going to climb out of hard, physical work at small pay, into the class of Building Engineers who earn enormous salaries? There's only one way—you've got to **KNOW** every branch of Building work. You've got to *learn* materials, design, estimating, drafting—all the engineering and business subjects which the high-priced Building Expert has at his finger tips!

Complete Home-Training in 2 Years!

Consider the many trades, materials, and services employed in building construction today, and then you will understand why a million dollar educational institution, like the American School, can supply home-training covering all phases of building and contracting. Simplified for easy understanding by mechanics, carpenters, and others with ordinary schooling. Condensed to 2 years' spare-time instruction with all unnecessary matter eliminated. Practical, yet scientific. Not a lot of books to read, but actual lessons, jobs, examinations, personal instruction, consulting service, etc. "This course is worth \$1000—I do not see how you can sell it for so little money, and on terms of only \$5 a month," writes a student.

Six Billion Dollars a Year!

BUILDING has become one of the fastest growing industries in America. Our Employment Department reports thousands of positions open for Experts at \$100 to \$400 a week. Amazing opportunities to go into the Contracting business always available to Building Engineers. We have assembled facts and figures about the great building game which will astonish you. Coupon brings complete information and 3 test lessons, free.

Test yourself with 3 Free Lessons

lessons actually Free to prove that this home-training can be mastered by men with ordinary schooling at home in spare time. Get my free book telling all that is included in this wonderful course. (Space allows giving only a few titles here.) Get my contract to train you for a better job and a big raise in pay, or to refund your money. Coupon brings everything—mail it right away!

\$100 a Week in This Fascinating Work

\$50 to \$250 a Week Paid to Good Cartoonists! You Can Easily Learn This Fascinating Profession Right at Home in Spare Time. Send for Free Booklet Explaining Method.

THERE isn't a more attractive or highly paid profession today than cartooning. Millions of dollars are spent every year for good cartoons by the 20,000 or more newspapers and magazines in the United States alone. Capable cartoonists earn \$50 to \$250 a week. Fontaine Fox, Briggs, Bud Fisher, Sid Smith and others *make more money* than the presidents of most corporations. Think of it!

Quick Easy Way to Learn Cartooning

Yet of all the professions cartooning is now positively one of the easiest to learn. You don't need to know a thing about drawing. Through our amazingly simple method many who never dreamed they could draw have easily learned cartooning. You too—without any apparent talent at all—can easily learn to dash off side-splitting cartoons that may mean ease and independence for you within a surprisingly short time. You learn right at home, yet your work receives the personal correction of our successful instructors. Many students actually sell enough work during their training to pay for it.

Mail Coupon for Free Book

Learn more about the wonderful money-making opportunities in cartooning, and how this method makes it easy for you to learn. Read about our students—their success—what they say—how easy it was—actual reproductions of their work—how they made big money while studying. Booklet entirely free. Send for it NOW. Washington School of Cartooning, Room 307-D, 1113-15th St., N. W., Washington, D. C.

Buy Your Gasoline at Half Price!

JUST imagine buying first quality gasoline for only 9c a gallon! For now an amazing new invention makes practically any car give twice its regular mileage to the gallon—actually giving you your gasoline at half price by making every gallon do the work of two!

giving it fully 50% more power—breaking it up so that it explodes instead of burning.

A Carbon Remover

Not only does this invention save half the gasoline, but it also saves the expense and time of having carbon scraped out—a job costing from \$5 to \$25.

61 Miles On a Gallon

With this wonderful new invention auto drivers in all parts of the country have chalked up records of from 37 to 57 and even 61 miles on a gallon of gasoline. Every day we hear of some new record—some difficult feat such as pulling a car through deep sand, or up a mountain, on half the usual gas.

Here's how this wonderful little device works—how it adds more power and mileage to any make or model car. Every carburetor is adjusted to make starting easy. But once the engine gets heated up the mixture is far too rich, resulting in faulty explosion. Half the gasoline is drawn into the cylinders in a raw state, and, instead of exploding, it burns. This causes a heavy deposit of carbon.

But with this startling little device in a car all this is changed. As soon as the engine warms up, this device automatically begins to admit a much larger volume of air, thoroughly vaporizing all the gasoline,

AGENT EARNS \$94 A DAY

The Stransky Vaporizer is one of the biggest sales propositions of the century—you can make big money quick. Vernon Gaines made \$94 in just one day. Read what these men say.

\$120 A DAY

I have found out that the Stransky will do what you said it would. I took forty orders in one day and wasn't out long.

\$147.50 IN ONE DAY

My profits for one day were \$147.50. In one week I made \$280. Yes, I am always on the job.—S. E. Herrick, Ore.

\$48 IN 3 HOURS

My gas bill has been cut nearly in half. I went out Saturday about three hours and secured 16 orders.—J. A. Williams.

Introductory Sample Offer

To introduce this new invention, Mr. Stransky, the inventor, will send a sample at his own risk. Not only that but he will actually pay you for testing his Vaporizer if you are not delighted with it! Write at once for his proposition. The demand for the Stransky Vaporizer is enormous. Agents handling this device are simply coining money. Splendid for spare time work.

Just send the coupon at once for full details of our introductory sample offer. Be the man to cash in big in your community. Mail the coupon right now.

The only man who could talk to the Superintendent

"SOON after I began studying," a student wrote to us the other day, "we had a change in management at our plant. I certainly was glad then that I had decided to study in my spare time. For, thanks to my I. C. S. course, I was the only man in the organization who could talk to the Superintendent in his own language. As a result, I was promoted over men who had been here from ten to twenty years. My salary has been increased 90% in the last ten months."

THAT'S a true story of what just one I. C. S. student has done. There are thousands of others. Every mail brings letters from men and women telling of promotions and increases in salary due directly to spare-time study.

One hour a day, spent with the I. C. S. in the quiet of your own home, will prepare you for success in the work you like best. Yes, it will! Put it up to us to prove it.

You Can Banish Weakness BY HEARKENING TO STRONGFORT

STRONGFORT

Dr. Sargent, of Harvard, declared that Strongfort is unquestionably the finest specimen of physical development ever seen.

fortism, you banish most of the diseases and weaknesses you may be afflicted with—by natural methods of development, without the use of drugs, dope, electrical gearings, or apparatus of any kind. It's a book of plain talk, crowded full of inside information, that you will find a priceless possession—a book that opens the way for you to get on the road to vigorous health and strength. You can't afford to be without it. I'll be glad to send it to you if you'll just fill out the attached coupon and frankly tell me what troubles you. Send for your copy of this valuable illustrated book today. Don't put it off.

Don't be a miserable weakling another day. You need not go on shuffling, shambling through life like a cur dog with his tail between his legs. You needn't be laughed at by men and shunned by women. Don't stand the gaff; you can be a vigorous, powerful fellow with rolling muscles, a grip like iron and a punch that will make the bullies sit up and take notice. Of course you feel hopeless about your condition if you are all run down, fagged out and devitalized. You haven't ambition enough left to do anything or get anywhere. But don't be discouraged.

I CAN HELP YOU

I have put thousands on their feet after they had been dragged down so deep they thought they never could be real men again. I gave them stamina, pep, vigor, energy, ambition. I built them up inch by inch—internally and externally—by my original methods—until they were robust, powerful fellows who commanded attention everywhere—some of my pupils becoming famous athletes and strong men, devoting themselves to physical instruction and exhibitions of feats of strength. I have hundreds, yes, thousands of testimonial letters proving that by my unique system I have worked wonders with men's bodies—first by restoring them to health, then developing them into wonderful specimens of muscular strength.

STRONGFORTISM

Science of Health and Strength

It was through the methods I used in developing my own body until I won the world's record as the finest specimen of muscular development and championships in feats of great strength, in Europe and in the United States, that I constructed the science of Strongfortism. It is through it that I reclaim wrecked and weak men, make them into new beings and give them a body and arms of which they can boast.

I require you to use no apparatus. No drugs or medicines are prescribed. No inconvenient hours are required. Only a little of your time in the privacy of your own home is necessary to follow my easily understood instructions—and, oh man, how glad you'll be that you listened to me, once you've started on my course. It means a new day for you, that's sure as you're alive.

You Can Banish Your Weakness

Once the internal organs are performing their duty and health and energy are restored, outward muscular development comes along in a way that will surprise you and your friends. A new outlook on life dawns for you when you become a Strongfort pupil. You'll find joy in your tasks, pleasure in mingling with men and women; you'll experience a desire for companionship. It's wonderful how you'll grow into a happy, healthy, robust fellow—and it's all so easily accomplished if you'll just listen to my advice and instructions.

READ MY GREAT FREE BOOK

—It's a Revelation!

You'll find surprising facts about the human body in my wonderful illustrated book—"Promotion and Conservation of Health, Strength and Mental Energy"—the result of my lifetime study of the human organism and the relation of muscular development to health and strength. It shows how, through Strong-

BOYS

Drawn from actual photograph of student doing spare time electrical work

Learn Electricity Make Big Money

How would you like to earn two or three dollars every evening after school and prepare yourself for a fine big job at the same time? Here's the opportunity of a lifetime for you fellows who like Electricity. Begin right now to prepare yourself for a regular man's size job in this fascinating field. Your chances for a big success are simply wonderful—the pay is big (thousands of men earn \$70 to \$200 a week) and advancement comes swift and sure.

I Will Train You at Home

With my easily earned, spare time Electrical Course I will train you at home like I have trained hundreds of other boys who are now big successful men. It will not interfere with your school work and you can earn more than the small cost of the course doing odd electrical jobs in your spare time. The Course pays for itself. I will show you how to get this work and how to do it. Some of my boy students make \$10 to \$15 a week this way.

Tools, Apparatus and Radio Course—Given Without Extra Charge

Send me the coupon below and I will tell you all about the big outfit of tools, apparatus and instruments and a new Radio Course that I am giving to my students for a limited time. I will send you my big interesting Electrical Book and a sample lesson, too—all Free. You will be tickled with the things I will send you Free. Mail the coupon right now.

COOK WITHOUT COAL

At last the ideal way to cook in the summer without coal or wood has been discovered. This is a new invention called a "Heat Fountain" which converts any stove or range into a gas stove. It combines ordinary kerosene (coal oil) with air to have a perfect cooking gas. No piping—no changes to your present stove or range necessary. Simply slip this little device into it and you have instant cooking heat at the turn of a valve. Easily regulated to simmer a tea kettle or bake an oven full of bread. Already over 275,000 women have found this wonderful device a veritable life saver. Find out how you can do away with the misery of a hot kitchen in summer—get rid of soot, ashes, dirt, smoke and drudgery of coal and wood. Yet use your own range. Use this new invention on 30 days trial. Simply write for free book, and full details of our offer. Send name and address to

A NATIONAL CALL

For Fire Prevention Experts —at \$5,000 to \$10,000 a Year

NOW, a new way to fight fire is sweeping the country. An amazing new chemical—absolutely harmless to rugs, furniture and human beings—multiplies itself hundreds of times in a smothering vapor blanket that snuffs out fire instantly. Fyr-Fyter hand pumps shoot this liquid 20 to 30 feet—the most effective fire-fighting force the world has ever seen.

A Great National Movement

This new way to fight fire can easily mean \$10,000 a year to you. All America is turning to it. Every month, by hundreds and by thousands, homes, factories, hotels, new buildings, and institutions adopt Fyr-Fyters. Great organizations like General Motors, Firestone Tire, Ford Motor Co., Standard Oil and hundreds of other large concerns are using the new Fyr-Fyter, and continue to purchase regularly.

Unlimited Opportunity

The demand is enormous. The surface has hardly been scratched. Thousands of factories, churches, stores, offices, garages, schools, etc., etc., want Fyr-Fyters. Countless owners of new buildings will buy almost without question. One city block is capable of sales running into thousands of dollars.

Everybody wants fire protection. It costs only a few dollars. It often pays for

itself in lowered insurance rates alone. Millions read of fire catastrophes daily. The newspapers are full of it. 17,000 lives are lost yearly. Every two minutes a building burns down. Millions see these fires daily. Every fire can mean \$100 to \$1,000 to you. Let this great national movement to wipe out fire sweep you into one of these \$5,000 to \$10,000 jobs!

Full Time or Spare Time

Experience is not necessary. There are various ways in which men in every walk of life can cash in on this outstanding opportunity—spare time or full time—big

city or small rural community, anywhere.

FREE Training

We start you. Train you at home, free. Give you a 90-page manual that covers every point. Tells you exactly how to sell. We make you a Fire-Prevention Expert capable of earning \$5,000 to \$10,000 a year or more.

FREE Book

Let us send you a free book, "Building a Permanent Income." See how hundreds of men have doubled their incomes. Read how scores of men like George, Viles, DePries, Hickey, Gill, Pollock, etc., entered this field and suddenly found themselves making \$100 to \$300 every week. How Baker, Oregon, 68 years old, who can work only occasionally, often makes \$25 to \$30 a day.

Make This Test

See how easy it is to start. We require no capital. We do not demand all of your time. Do not make the mistake of trying to judge your earnings as a Fyr-Fyter man until you get the full details of Fyr-Fyter's amazing plan. The Fyr-Fyter sales force is one of the highest paid sales organizations in the world. Probably more men are making \$5,000 a year—or more—with Fyr-Fyter than with any other direct selling company on earth. Don't miss this lifetime opportunity. Grasp it today. Simply mail the coupon.

AGENTS

A brand new extinguisher at a startling new low price sells fast to stores, factories, schools, garages, homes, farms, etc. Everybody wants fire protection at this amazing low price. Agents breaking all records—making any number of \$30 and \$40 days! Payne, Ia., averaged \$20.77 for 217 days. Greene made 47 calls and sold 35. Join the biggest money-makers in direct selling. You can easily make \$15 a day with this one extinguisher alone—and up to \$10,000 a year, picking up big quantity orders. Mail coupon quick for full offer.

O. C.
MILLER
Director
Extension
Work
American
School

The American School

A million Dollar *No-Profit* Educational Institution, now offers men a *double* service—training for a specific job, then help finding the job. For one small price, on terms of only \$5.00 a month, you are now assured of definite benefits, both in position and salary. Write for complete information—*today!*

No machine can be built until the Draftsman first builds it on paper. My training prepares you for this work.

Never has the world seen anything like the building boom of today. This has created enormous demand for real Draftsmen.

5 BIG-PAY Branches

The big money in Drafting goes to men who specialize in Machine Design, or Electrical Drafting, or Architectural Drafting, or Structural, or Automotive. It is not enough merely to know *general* Drafting practice. You must know how to calculate and design and plan original work. You need many Engineering subjects to fill the kind of a Drafting position that pays \$60 to \$125 a week. The American School now includes this specialized training in its Drafting course.

Costly Drafting Outfit Given!

Fine, imported instruments like these help you learn Drafting quickly and easily. These standard quality, full size instruments, board, table, triangles, T square, ink, protractor, etc., given to every student without extra cost.

O. C. Miller, Director Extension Work

AMERICAN SCHOOL

Dept. DB-74
Drexel Avenue and
58th St., CHICAGO

3 Drafting

to prove you can

We have invented a new, simplified way to teach Drafting—the first real improvement in Drafting home instruction in history. We want you to see a few of these new Job-lessons, try them, test your own ability to master them—without one penny of cost or obligation. For instance you will see how we get away from the “copying” methods used in the past, so you develop into a DRAFTSMAN, instead of a “tracer.” See for yourself the ingenious new method which compels you to think, to solve problems, to do actual Drafting-room jobs from the very first lesson!

A New, Rapid, Simplified Training

Copying drafting lessons prepares you to be only a “tracer.” This new “Job-Method” gives you actual drafting-room jobs in a new one-step-at-a-time way. With pictures which you can understand almost without reading the “lessons.” And that is why the American School-trained Draftsmen can qualify for a good job at big pay when they graduate.

Win Success Thru Drafting

Drafting is easy, fascinating work. Short hours. Big pay. And the Draftsman is always in line for promotion to executive positions. This training is *complete*. It includes high school subjects (if you need them) and all the Engineering and Mathematics Drafting experts require.

FREE Job Service!

The American School now offers its students and graduates, without cost, the services of an efficient employment department keeping in constant touch with employers of Draftsmen all over the U. S. We have placed hundreds of men in good, big-pay Drafting positions. We've made this training so complete, so practical, so easy to master, that our students are bound to *make good*. And so, because the demand for real Draftsmen continues to exceed the supply and because this training actually prepares men for good Drafting positions we back it with a Free Employment Service.

Lessons *Actually* FREE

Read These Letters!

City of Chicago
Department of Buildings

Gentlemen: The same day I received my diploma I got word that I was one of the two candidates who had successfully passed the examination for Deputy Commissioner of Buildings of the City of Chicago, a position paying \$3600 per year.

There were eight applicants examined besides myself, all men well known to the architectural and engineering profession. Seven of these failed to obtain a passing grade of 70%. My grade was 84.69.

Inasmuch as I failed to pass this same examination three years before, my present success is mainly due to the knowledge gained through your School.

Yours very truly,

ROBERT KNIGHT

Got His Draftsman's Job

"I wanted to let you know how I came out in getting that job at the Brownell Co., Dayton, Ohio. I was to start and have a trial at Drafting, and I am still in the Drawing room. The engineer seems to like the work I make, and also the other draftsmen. I thank the School very much for getting me in at this place, because your letter of recommendation helped me a whole lot to get the job."

BERNARD WEBER.

730 St. Nicholas Ave., Dayton, O.

Liberty
High School
Bethlehem, Pa.

Dear Sirs:—This is to thank the American School for all that you have done for me since I signed up for the Drafting and Design Course.

In the eight years since then, I have gradually climbed from the position of tracer to that of Head of the Department of Machine Drawing and Design in our magnificent new \$2,000,000 High School here, at many times the salary which I received at that time.

The officials of the Pennsylvania State Department, and Dr. Wm. C. Ash of the University of Pennsylvania, all claim that our course in Drafting and Design is the best now being taught in this state. Every drafting graduate that we have turned out has proved successful, and one is now Chief Draftsman in a local steel concern. Yours Sincerely,

J. S. LEAR

Has Charge of Large Jobs

"Even before I had finished my course, I was put in charge of large construction jobs in different cities. I have been doing that ever since, and the jobs are getting larger all the time. I owe my success to the American School because of the knowledge I gained in mathematics and calculations."

ELMER L. LAMB,
1908 Smith St., Peoria, Ill.

Men Who Fear Old Age~

Recently some startling facts have been uncovered by modern scientific research, regarding men who have passed their fortieth year—and are suffering from frequent nightly risings, backache, sciatica, loss of pep and other ailments. In some instances, the nerves are disturbed and the procreative order of things disarranged. Now it is proved entirely wrong to assume that these are natural symptoms of a natural physical decline due to advancing age. Science says that they are often due merely to a disorder of the prostate gland. And now an amazing simple home hygienic practice, restores the prostate gland to its natural function. Thousands of bankers, lawyers, and other users praise it. A free book entitled "Why Men Are Old at 40" explains the powerful influence of the prostate gland on general health—and how this modern simple method banishes aches and pains. No obligation—send for it today. The Electro Thermal Company, 2159 Main Street, Steubenville, Ohio. Western Office: Dept. 21-B, 711 Van Nuys Bldg., Los Angeles, Calif.

Astonishing New Discovery Seals Punctures Instantly

Good-Bye Tire Troubles! You Ride on Air Just as Before—But Without Fear of Changing Tires or Patching Tubes. Aer-Pruf Seals Punctures Automatically—While You Drive. Absolutely Sensational! Read Inventor's Amazing Free Sample Offer Below.

857 Nails in Tire — LEAKS NO AIR

HERE is an amazing new invention that makes any tire puncture proof—and adds 100% to the joy of motoring. Experts claim it is the greatest auto discovery in the past 10 years. And automobile owners everywhere are simply delighted.

Punctures Sealed While You Drive

This wonderful, new, scientific discovery—the work of O. S. Nelson, of South Dakota—is called Aer-Pruf. Under test, it held air into an old tire punctured with 857 nails—without a single leak! It seals punctures the instant they happen—so that you go spinning along without even knowing you have a puncture! It does away with changing tires and patching tubes either in the garage or on hot, dusty roads—in blazing sun, in drenching rains, on dark nights, in freezing snow storms! No wonder it appeals to every motorist, without exception!

Aer-Pruf will seal punctures as large as a twenty penny spike or as small as a tack. You ride on air just as before—but with protection against “flats,” leaks, etc. Aer-Pruf will not freeze in zero weather and will resist the heat of the hottest summer day. It has no injurious effect on casing

or tube. Will last lifetime of the tube or tire. And only a few minutes are required to puncture-proof four or five tires with Aer-Pruf.

Rejuvenates Old Tires

Aer-Pruf puts new life into old tires and prolongs their usefulness in an astonishing way. It seals troublesome slow leaks, valve leaks and porous tubes. It prevents rim cuts, and cracked side walls. And it actually doubles tire mileage because it prevents driving with partly flat tires—the biggest cause of tire troubles!

When Aer-Pruf accomplishes such wonderful results, is it any wonder that automobilists in every state in the Union are uniting in universal praise for this surprising invention?

Free Sample Offer Now, to introduce his new invention, Mr. Nelson will send you samples at his own risk. But that's not all. He offers to *pay you for testing Aer-Pruf* if you are not amazed and delighted with results! This surprisingly generous offer is limited—so take advantage of it without delay. See for yourself how astonishing this new discovery really is! No obligation. Clip the coupon at once. Mail it today!

AGENTS \$150 a Week

The demand for Aer-Pruf is simply startling. Agents handling this sensational discovery are making money hand over fist. J. O. Bright made over \$29 in two hours. Henry J. Dubois netted \$9 profit the first 5 minutes, just showing it to friends. Most amazing thing to demonstrate you ever saw. Simply drive nails into an old tire in front of interested crowds. Nine out of ten auto owners want to buy on first sight. No sales experience needed! Splendid for spare time workers. Send coupon below for generous proposition.

Trying to quit the tobacco habit unaided is often a losing fight against heavy odds, and may mean a serious shock to your nervous system. So don't try it! Make the tobacco habit quit you. It will quit you if you will just take **Tobacco Redeemer** according to directions.

It doesn't make a particle of difference whether you've been a user of tobacco for a single month or 50 years, or how much you use, or in what form you use it. Whether you smoke cigars, cigarettes, pipe, chew plug or fine cut or use snuff—**Tobacco Redeemer** will positively remove all craving for tobacco in any form in a few days. Your tobacco craving will usually begin to decrease after the very first dose—there's no long waiting for results.

Tobacco Redeemer contains no habit-forming drugs of any kind and is marvelously quick, scientific and thoroughly reliable.

Not a Substitute

Tobacco Redeemer is in no sense a substitute for tobacco, but is a radical, efficient treatment. After finishing the treatment you have absolutely no desire to use tobacco again or to continue the use of the remedy. It helps to quiet the nerves, and will make you feel better in every way. If you really want to quit the tobacco habit—get rid of it so completely that when you see others using it, it will not awaken the slightest desire in you—you should at once begin a course of **Tobacco Redeemer** treatment for the habit.

Results Absolutely Guaranteed

A single trial will convince the most skeptical. Our legal, binding, money-back guarantee goes with each full treatment. If **Tobacco Redeemer** fails to banish the tobacco habit when taken according to the plain and easy directions, your money will be cheerfully refunded upon demand.

Let Us Send You Convincing Proof

If you are a slave of the tobacco habit and want to find a sure, quick way of quitting "for keeps" you owe it to yourself and to your family to mail the coupon below or send your name and address on a postal and receive our free booklet on the deadly effect of tobacco on the human system, and positive proof that **Tobacco Redeemer** will quickly free you from the habit.

A Better Job Now or—

Earn \$70 A Week and More

Why take small pay from uncertain jobs? Why be knocked around from this to that, and not know whether you are going to have a job tomorrow or not? You can change all that. Learn a good trade. Know autos—how to repair them, and take advantage of the countless opportunities to make money. Pave the way for a business of your own—a business that can make you independent for life. You can do it with a few weeks' training at the Michigan State Automobile School—the great auto-trade school in the heart of the auto industry.

You Can Earn More Money

Skilled auto men are wanted everywhere at good pay. Service managers tell us that **100,000 more trained auto men are needed every year.** They don't get a tenth of that number now. Here is your supreme chance to get out of the rut of poor pay. 20 million cars now, and three or four million more new ones every year. Think of it! Come to Detroit, the heart of this great business. Study autos where they are made.

LEARN IN A FEW WEEKS—START NOW

Levite O. Cyr, Madawaska, Maine, earns \$9.00 to \$10.00 a day as Auto Electrician and expert mechanic. He was a common laborer before taking "Michigan State" Training.

Martin Vander Bie, Holland, Michigan, makes a big success selling cars, and now is partner in a \$150,000 business.

J. R. Navarre, Carrollton, Ohio, formerly day laborer, now earns \$250.00 a month as foreman of a Dodge Service Garage.

A thorough training in Detroit at the "Michigan State," fattens your pay envelope if you are working for others, or puts more profit in business for yourself. You can take a full Automotive Course in 12 weeks, or our big Master Course in 30 weeks. Or specialize in any of its money-making branches; you can be an Auto Electrician, a Battery Man, Welder or Machinist.

Jobs for all these men are offered to us daily. Free Course in Business, Garage Management and Selling given to all our students. Classes always open.

Work With Real Tools

And learn to use them right. You must have expert training to get the good pay jobs. We train you with tools. You learn from practice, how cars are made and how to repair them. You have head training as well as hand training. The man whose hands only are trained, fails when he hits the hard jobs. There are no hard jobs for Michigan State trained men, for they have the knowledge in their heads to guide the skill in their hands.

Complete Equipment—Expert Instructors

Here you learn on up-to-date, new equipment. All types of cars, engines, axles, transmissions, electrical systems. New Packard Straight Eight with four wheel brakes, Packard Twin Six, New Buick with four wheel brakes, Oakland (four wheel brakes), Cadillac Eight, Rep, Jewett, Oldsmobile, G. M. C. Truck, Hudson, Overland, many others. Each instructor is a master in his line. Their knowledge fits you for success.

L. O. Beyer, Idaho, writes us: "Your training has paid me bigger dividends than any money I ever spent. My business now runs \$22,000 per year."

You get practical shop training at the "Michigan State," in Detroit, the Auto Center. The knowledge we put in your head guides the skill we put in your hands. P. F. Peterson, Chicago, writes, "I'm employed at a service station here in charge of all electrical work, repairing generators and starting motors."

No Experience Required

Whether you have auto experience or not, makes no difference. Green men get this training and start at once in better jobs, soon advance to have their own business, make big money. Men who have experience also say this training puts them way ahead of other men, into the big pay class at once, saves them years of dirty work. In just a few weeks, if you start now, you can be doing work you like and earning this bigger pay!

NO EDUCATION NEEDED EITHER. It just takes common sense, to learn by the practical methods we teach you. R. L. Beck (Pa.), "In two years my wages were increased 300%."

Learn Autos Where Autos Are Made

A Business of your Own!

Trained Auto Men Are Wanted

"Michigan State" graduates are making money in every corner of the world. 20,000 graduates. 700 students here now. Come to Detroit, a fine city. Big business, pleasant climate all year round.

Auto Business Leads

Autos are increasing faster than repair shops or mechanics can keep up with them. The auto industry now leads all industries in value of production. There are more autos than telephones. 269 cars to every service station. This shows as plain as A-B-C where the big chance is today.

20,200,000

Send for New Big Catalog

If you want to earn more, cut out the coupon at the bottom of this page and mail it today. We'll tell you how to start. We will also send you our NEW BIG CATALOG of courses. Read about how our graduates earn up to \$200 a week. They tell you in their own words. Get these facts now, for they may mean a wonderful difference in your own life. Don't wait. Fill in the coupon and mail it now.

John Grahek, Chisholm, Minn., averages \$425.00 a month profits in his small town repair shop.

Ben Koehler, Pulaski, Wis., made \$10,000 his first year in business, with a garage and Ford Agency.

J. I. Moyes, Barnes, Kansas, makes a good salary for himself and saves \$100.00 a month extra, from his Auto Electric Service business.

READ THIS LETTER

STATE OF MICHIGAN
DEPARTMENT OF PUBLIC INSTRUCTION
DIVISION OF REHABILITATION
LANSING, MICHIGAN

Lansing
April 12, 1908

Mr. A. S. Brantley, Pres.
Matthew Fontaine Maury High School
Norfolk, Va.

Dear Mr. Brantley:

I am glad to tell you that I consider the Michigan State Automobile School of Detroit, Michigan, the best of its kind in the country. I am personally acquainted with the school, what it has to offer, and the officials in charge, and on the basis of my relationship with the school for the past four years recommend it very highly to you.

It is natural to assume that this would be the best school of its kind in the country. It is located in the center of the world's largest industrial automobile activities. The regular class room instruction and practical work are combined in such a way as to make for the best progress as regards speed and accuracy in theory and practical application both. The students actually work on every make automobile and every make automobile accessory.

As regards the standing of this school among the educational institutions of our state, there is even other just like it. It is recognized by this department for reputable and dependable work.

Very truly yours,

Harry Rogers

Harry Rogers
State Supervisor of Manual Arts

Come to Detroit

Of course Detroit is the place to learn autos. Stick this in your memory—the Detroit trained man has an immense advantage over all others. So come here as soon as you can. Come now if possible. But even if you can't come right now, you can start anyway, to get ahead in the world! The great Success-training of this world-famous "Michigan State Automobile School" can be brought to you at home. You can start to learn under our Home Study Plan. (This does not cost anything extra.) It will help you to get a garage job right away. Then plan to come here to School later to finish in thorough "Detroit training."

Earn While You Learn If Necessary
Or come to Detroit and work your way. Some students work evenings to pay their expenses. Others work days and take our evening classes.

—now he enjoys an \$8,000 income thru Higher Accountancy

From a routine job that offered him little or no opportunity for advancement, Fred F. Ames has been able in a comparatively short time to lift himself to a position where his income is now more than \$8,000 annually.

Mr. Ames was employed by a railroad; his salary was \$91.65 a month. The deadly sameness was robbing him of his initiative. He looked into the future and he saw his inability to hold a better position.

He enrolled with LaSalle Extension University. Higher Accountancy was his goal. Now he is a Public Accountant and a Tax Specialist, with offices of his own. "My success is due chiefly to your course," he writes: "if I had not enrolled with you, it is quite probable that I would still be a railroad clerk at a salary which would not exceed \$200 per month."

Send for Free Book— "Accountancy, the Profession that Pays"

Higher Accountancy—a profession on the same plane with law or medicine—is offering untold opportunities to ambitious men and women. Questions of income tax, auditing, cost accounting, have created hundreds of new executive positions. Accounting knowledge is fundamental to the successful management of business.

A complete plan whereby you can advance to positions of responsibility and power in the Accountancy field is clearly outlined in LaSalle's new 64-page book, "Accountancy, the Profession that Pays." The information it contains is of priceless value to the man eager to achieve success in business—and LaSalle will send it to you free.

If you have the urge and the will to increase your income—clip and mail the coupon NOW.

— Find Yourself Thru LaSalle! —

Rush to me, WITHOUT CHARGE, pointers on how to get a position as Mail Carrier or Post Office Clerk and give full particulars with sample coaching.

"Four Raises in Two Years"

"And it hasn't been hard to get them, either. Why, it seems only yesterday that I was wondering if I would ever make as much as \$45 a week. And now I'm making \$75.

"Tom Dawson was speaking about it today. 'Gee,' he said, 'I wish I had started studying with the I. C. S. when you did. Here I am plugging away at the same old job and the same old salary while you've gone 'way up. I bet you're making twice as much as I am. And to think that two years ago we were working side by side.'

"I told him it wasn't too late if he would only make the start and he said he was going to send in one of those I. C. S. coupons right away.

"I hope he does, because an I. C. S. course is the very thing he needs to get out of the rut. I wouldn't be making anywhere near \$75 a week if I hadn't started to study just when I did."

How much longer are you going to wait before you take the step that will bring you advancement and more money? To earn more you've got to learn more. And to learn more you've got to study in that hour after supper that most men throw away.

One hour a day, spent with the International Correspondence Schools in the quiet of your own home, will prepare you for the position you want in the work you like best. Put it up to us to prove it.

LUMINOUS PAINT

Make Your Watches, Clocks, Etc., Visible by Night

The very latest discovery in the scientific world, hitherto practically unobtainable except as an exorbitant price, we have at last succeeded in producing this remarkable LUMINOUS PAINT, which, applied to the surface of any article, emits rays of white light, rendering it perfectly visible in the dark. **THE DARKER THE NIGHT, THE MORE BRILLIANT IT SHINES.** Quite simple to use. Anyone—you can do it. A little applied to the dial of your watch or clock will enable you to tell the time by night. You can coat the push buttons or switch plates of your electric lights, match boxes, and innumerable other articles; make your own Luminous Crucifers, Luminous Rosaries, etc. Small bottle, price 25c. Larger size, 50c and \$1 postpaid. **JOHNSON SMITH & CO., Dept. 558, RACINE, WIS.**

Serpent's Eggs

Box contains 12 eggs. When lit with a match, each one gradually hatches itself into a snake several feet long, which curls and twists about in a most life-like manner. Price per box, 10c postpaid, 3 for 25c.

CIGARETTE MAKER

Roll your own and save money. Makes them better and quicker besides saving more than half. Use your favorite brand of tobacco. Neat, useful and handy. Pocket size, weighs 1/4 lb. Made entirely of metal, nickel-plated. Price 25c postpaid.

MIDGET BIBLE

GREAT CURIOSITY Smallest Bible in the World. Size of a postage stamp. 200 Pages. Said to bring good luck to the owner. A genuine work of art. Must be seen to be appreciated. Make good money selling them to friends, church acquaintances, etc. **PRICES 15c each, 3 for 40c, 12 for \$1.35, 100 for \$7.50.** Also obtainable in Leather Binding, with gold edges. Price 50c each, 3 for \$1.25, \$4.50 per doz. Magnifying Glass for use with Midget Bible, 15c.

STAGE MONEY

With a bunch of these bills, it is easy for each person of limited means to appear prosperous by flashing a roll of these bills at the proper time and peeling off a genuine bill or two from the outside of the roll, the effect created will be found to be all that can be desired. **Prices, postpaid: 40 Bills 20c, 120 for 50c, or \$3.50 thousand postpaid.**

Wonderful X-Ray Tube

A wonderful little instrument producing optical illusions both surprising and startling. With it you can see what is apparently the bones of your fingers, the lead in a lead pencil, the interior opening in a pipe stem, and many other similar illusions. A mystery that no one has been able to satisfactorily explain. Price 10c, 3 for 25c, 1 dozen 75c. **Johnson Smith & Co.**

Good Luck Ring
Quint and Novel Design

A VERY striking and uncommon ring. Silver finish, skull and crossbones design, with two brilliant, flashing gems sparkling out of the eyes. Said by many to bring Good Luck to the wearer, hence its name, Good Luck Ring. Very unique ring that you will take a pride in wearing. **ONLY 25 CENTS.**

Holster (Cowboy Type) for Blank Cartridge Pistol, 60c.

Johnson Smith & Co., Dept. 558, Racine, Wis.

BOYS! BOYS! BOYS!

THROW YOUR VOICE

Into a trunk, under the bed or anywhere. Lots of fun fooling the teacher, policeman or friends.

THE VENTRILO

a little instrument, fits in the mouth out of sight, used with above for Bird Calls, etc. Anyone can use it.

Never Fails. A 32 page book on ventriloquism, the Ventrilo, ALL FOR 10 CENTS

Exploding Cigarettes

JUST LIKE ORDINARY CIGARETTES. BUT SUCH REAL STARTLERS! The box contains ten genuine cigarettes of excellent quality. They appear so real, but when each cigarette is about one-third smoked, the victim gets a very great surprise as it goes off with a loud BANG! A great mirth provoker yet entirely harmless. Price 25c per box.

Popular Watch Charms

ONLY 15c
3 for 40c; \$1.35 doz.

Very pretty little curiosities and decidedly novel. Fitted with Magnifying Lenses that enlarge the pictures to a very surprising degree; in fact, it seems almost incredible that a clear picture could be possible in such a small compass, and how sharp and distinct they show up when you look through. Come in assorted views—Actresses, views of Panama Canal, Lord's Prayer in type, etc.

Mystic Skeleton

A jointed figure of a skeleton 14 in. in height, will dance to music and perform various gyrations and movements while the operator may be some distance from it. **10c & pd.**

Novelty Badges

Rising Permit 10c Two very novel metal badges, nickel plated, that you can wear, giving you fun out of all proportion to their trifling cost. **10c, each badge, 3 for 25c, or 75c per doz. p.p.d.**

MAGIC FLUTE

Wonderfully Sweet Toned and Musical

Post Paid 25c

The Magic Flute, or Humanatone, is a unique and novel musical instrument that is played with nose and mouth combined. There is just a little knack in playing it which, when once acquired after a little practice, will enable you to produce very sweet music that somewhat resembles a flute. There is no fingering, and once you have mastered it you can play all kinds of music with facility and ease. When played as an accompaniment to a piano or any other musical instrument, the effect is as charming as it is surprising.

LOOK 35c Look

Wonderful instrument. Greatest thing yet. Nine separate articles in one. Everybody delighted with it. Odd, curious and interesting. Lots of pleasure as well as very useful. It is a double Microscope for examining the wonders of nature. It is also an Opera Glass, a Stereoscope, a Burning Lens, a Reading Glass, a Telescope, a Compass, a Pocket Mirror, and a Laryngoscope—for examining eye, ear, nose and throat. It is worth all the cost to locate even one painful cinder in the eye. Folds flat and fits the pocket. Something great—you need one. Don't miss it. Sent by mail, postpaid. **Only 35c or 3 for \$1.00**

HOT DOG!

SENSATIONAL NEW NOVELTY

It is made of rubber like a small balloon. Contains a curious chemical that acts in a most remarkable way. Between the delicate balloon and the band and it suddenly becomes quite warm and fills itself up with air. It is SELF-BLOWING. They all sort of blown with it. Lay it on a chair; place it secretly underneath anyone; underneath anyone's pillow; drop it in someone's pocket, and after a short time, when friction causes the chemical to act, a large and superbly colored balloon develops. Each Hot Dog in a small box. Quite harmless bullocks of fun. **15c, each, 3 for 40c., \$1.35 doz. postpaid.**

Female SEX Male Sex Indicator

Hold the MAGIC INDICATOR over a man's hand—Instantly it moves in a straight line, backward and forward. Hold it over a woman's hand and it describes a complete and continuous circle. The same action can be obtained over a letter written by a man or woman, etc. It is fascinating; baffling. We have never been able to figure out how it's done, but we've never seen it fail. Many novel and entertaining feats may be performed with the Sex Indicator. For example, similar results can be obtained with animals, rats, dogs, rabbits, over birds, chickens, quackens, etc. Also used to predetermine the sex of chickens and birds, etc., in fact it is sold as a patented egg tester in Europe. Price 25c, or 3 for 65c. p.p.d. **JOHNSON SMITH & CO., Dept. 558, RACINE, WIS.**

THE TEDDY CAMERA

Takes and Finishes an Excellent Photograph on a Card 3 1/2 x 2 in One Minute

It is the newest method of photography in which skill and experience are not necessary. Not a plate nor a film camera, but a camera that produces the complete picture. Does not use either plates, film, or dark-room. All the troubles of picture-taking in the ordinary manner are swept away. It eliminates all the mess and trouble and, above all, there is no waiting, for you actually see the finished picture in One Minute. You merely place the cards in the camera, press the shutter, drop the card into the automatic developing tank attached to the camera, and in One Minute you have a Completed Picture all finished and ready to show. It is so simple and easy that any child who can use its handle can take good pictures. The camera weighs little more than half a pound, and measures about 4 1/2 x 3 inches, easy to carry about and always ready to take and finish a picture in one minute. The Lens is of high grade, universal focus, needs no adjustment, and takes clear and brilliant pictures at any distance. The Shutter works perfectly and responds to very slight pressure. It loads in broad daylight. The Developing Tank is attached to the Camera and holds a single solution that develops, tones and fixes the picture in one minute with absolute certainty and with no care or attention on the part of the operator; it cannot be over-developed. Produces a picture 3 1/2 x 2 inches. Send today and have the never-failing pleasure of making excellent pictures of your family, friends or neighbors, your house or your domestic pets. **Price of Camera Complete with Developer and Package of Cards, ONLY \$2.50.** Extra packages Sensitized Cards 15 cents per package; extra Developing Solution 25 cents. All prices are postpaid to any address in the world.

\$2.50

Every Boy His Own Toy Maker! **INVISIBLE INK**

Greatest boys' book written. Tells how to make a Pinhole Camera, a Canoe, model Railroad, a Telephone, Boomerang, Telegraph Instrument, Box Kite, Talking Machine, Microscope, Electric Motor, Electric Door Bell, Water Wheel, Paddle Raft, a pair of Skis, a Dog Sled, Bird House, Rabbit Yard, etc. 64 pages, 150 illustrations. **PRICE, 10c postpaid; 3 for 25c.**

The most confidential messages can be written with this Ink, for the writing **Makes No Mark.** Cannot be seen unless you know the secret. Invaluable for many reasons. Keep your postals and other private memorandums away from prying eyes. Great fun for playing practical jokes. **Only 15c a Bottle; 3 for 40c.**

REAL PISTOL Miniature Watch Charm Pistol

Exact reproduction of a real pistol; actually fires **Real BLANK CARTRIDGES** of miniature size. Illustration is actual size. 1 1/4 inches long, with ring at end for attaching to watch chain. Loads like a regular pistol. Pull the trigger and it goes off with a loud bang. Pistol is break-open type; illustration shows position for loading. Made entirely of high grade steel, nickel plated, octagon barrel, handsomely engraved handles, complete in box with cleaning rod. **PRICE \$1.75.** Also furnished with pearl handles, \$2.50. **BLANK CARTRIDGES, 50c per box of 25.**

RESURRECTION PLANT

One of the most wonderful plants known. Possesses the strange power of turning in a few minutes from an apparently lifeless, dry herb to a **BEAUTIFUL LIVING FERNLIKE PLANT** of a dark green color. Simply place the plant in saucer of water, it will open up and start to grow in 20 minutes. When taken out it will dry up and go to sleep until placed in water again. Fine house plant—summer or winter. **10 cents each or 3 for 25c., 75c per doz., postpaid.**

Microphone Transmitter Button

\$1.00 POST-PAID

You can easily make a highly sensitive microphone by using this Transmitter Button to collect the sound waves. You can build your own outfit without buying expensive equipment. It is simple and inexpensive. You can install an outfit in your home and hear conversations being held all over the house. You can connect up different rooms of a hotel. This outfit was used by secret service operatives during the war. It is being used on the stage. It is ultra-sensitive and is the greatest invention in microphones. You can connect the button almost anywhere—card board boxes, stove pipes, stiff enclanders, on the wall behind a picture frame, etc. Button is so light and small it cannot be detected. Persons can be overheard without suspecting it. You can listen in on conversations in another room. A deaf person in the audience can hear the speaker. Connected to phonograph, piano or other musical instrument, music can be heard hundreds of feet away. Button may be used to renew telephone transmitters often makes an old line "talk-up" when nothing else will. The ideal microphone for radio use; carries heavy current and is extremely sensitive. Amplifies radio signals. Countless other similar uses will suggest themselves. Experimenters find the Button useful for hundreds of experiments along the lines of telephones, amplifiers, loud speakers, etc. Many fascinating stunts may be devised, such as holding the button against the throat or chest to reproduce speech without sound waves. \$5.00 is given to anyone who sends in a new suggestion for the use of the Button providing the manufacturers find it suitable for use in their literature. **PRICE \$1.00 POSTPAID ANYWHERE.**

MAGICIAN'S OUTFIT

Apparatus and Directions for a Number of Mysterious Tricks Enough for an Entire Evening's Entertainment

ANYONE CAN DO THEM 75c

It is great fun inviting your friends. Get this Conjuror's Cabinet, and you will be the cleverest fellow in your district. It contains the apparatus for seven intricate tricks, including The Disappearing Rose, that, when placed in the lapel of your coat, vanishes from sight as will; The Magic Vase and Ball Trick; a Wonder Ball is placed inside, and upon replacing the lid has disappeared and is found in someone else's pocket; The Magic Nut with which you can apparently cut your finger almost in two; the Wonderful Card Trick (a card is placed in an envelope, and when upon an entirely different card is found); The Disappearing Cash Box (a coin is placed in the little wooden barrel, and, when opened again, is found to have vanished entirely, or can be made to change into a coin of another denomination); The Famous Dissolving Penny Trick; The Glass Goblet and Vanishing Coin Trick (a coin is dropped into a glass of water, and when the water is poured out the coin has vanished). With the tricks described above we send full printed instructions for performing each trick, so that anyone can readily perform all the tricks to the great amusement of their friends or the public. Any boy of ordinary intelligence, with this Cabinet of Tricks in his possession, can give a parlor entertainment not inferior to some regular magicians. Besides the tricks contained in the Cabinet, there are many other facts and illusions fully explained with full printed instructions, for which you easily make or procure the necessary apparatus. This unexcelled Cabinet of Tricks for **ONLY 75 CENTS POSTPAID TO ANY ADDRESS.**

Great Fire Eater

Most Sensational Trick of the Day!

With the Fire Eater in his possession any person can become a perfect salamander, apparently breathing fire and ejecting thousands of brilliant sparks from his mouth, to the horror and consternation of all beholders. Harmless fun for all times, seasons and places. If you wish to produce a decided sensation in your neighborhood don't fail to procure one. We send the Fire Eater with all the materials in a handsome box, the cover of which is highly ornamented with illustrations in various colors. **Price of all complete only 30 cents, postpaid.**

SQUIRT ROSE

25c

A REAL STARTLER. This is the most popular of all squirt tricks. The flower in your coat looks so fresh and sweet that everyone is tempted to inhale the delightful perfume. Then is the moment to press the bulb. Great-splendid! Don't they jump? There is a very long rubber tube that easily reaches to the pocket of your coat or trousers, and the bulb is large enough to make a dozen shots with one loading. **PRICE 25c each, or 3 for 65c postpaid.**

PISTOL, OPERA & FIELD GLASS

PRICE POSTPAID, \$1.00

It is made in the shape of and looks like a regular Automatic Pistol. No one is likely to stop and ask you whether it is real or not. This is likely to prove itself very handy in an emergency. On pressing the trigger it opens up, as shown in the illustration at the right, revealing nine most useful articles—Opera and Field Glass, Telescope, Mirror, Magnifying Glass and Burning Lens, Reading Glass, Sun Dial, Sun Compass, etc. In the handle of the revolver there is a place for various pocket necessities, such as First Aid Articles, Buttons, Pins, etc. The Pistol is of sheet metal, blued finish, that can be carried comfortably in pocket. **PRICE \$1.00.**

SURPRISE MATCHES

More fun than fighting with your wife. Look just like ordinary matches. Put up in boxes just like regular Safety Matches. As the victim tries to light one he gets quite a surprise. **PRICE 10c per box, 3 boxes for 25c postpaid, 12 for 75 cents.**

SEEBACKROSCOPE

By merely placing this clever instrument to your eye, you can see what is going on behind your back, and some times you see very interesting things when no one thinks you are looking. Why it is just like having eyes at the back of your head. **PRICE ONLY 25 cents, postpaid, 3 for 50 cents.**

NEW BOOK ON ROPE SPLICING

A most practical handbook giving complete and simple directions for making all the most useful knots, hitches, rigging, splices, etc. Over 100 illustrations. All about wire rope attachments, lashing, blocks, tackles, etc. 37 Heraldic Knots illustrated. Of great value to mechanics, riggers, campers, boatmen. **Price 20 cents postpaid.**

The "Little Giant" Typewriter

A First Class Writing Machine For \$1.50

A perfect little typewriter for \$1.50. There are thousands of persons who would like to use a typewriter but whose means and business do not warrant the expense attached to the purchase and use of a fifty or seventy-five dollar machine. To such persons we confidently recommend our Little Giant. It is strongly made, but simple in construction, so that anyone can quickly learn to operate it, and write as rapidly as they would with pen and ink. The letters of the alphabet most frequently used are so grouped as to enable one to write rapidly, the numerals 1 to 10, and the punctuation marks being together. With this machine you can send your best girl typewriter love letters, address envelopes, make out bills, and do almost any kind of work not requiring a large, expensive machine. With each typewriter we send a tube of ink and full printed instructions for using the machine. **Price complete \$1.50 by mail postpaid to any address in the world.**

JOHNSON SMITH & CO. Dept. 558 Racine, Wis.

\$5 DOWN NOW—*and No More Payments* Until October 1st BUYS ANY **WITTE Engine**

AUTOMOTIVE & ELECTRICAL SCHOOL

2731 SWEENEY BLDG. KANSAS CITY, MO.

MAKE BIG MONEY IN ELECTRICITY!

800% Pay Increase "I now make 8 times my former pay. I used to get \$60 a month—now it's \$480." Carroll Moeschler, Chaska, Minn.

\$9,000 a Year Auto Electricity pays W. E. Pence, Albany, Ore., over \$9,000 a year. 68 men enrolled for this training on his recommendation.

\$1,000 a Month John Jirinec 335 Dittman Ave., Astoria, L.I., now earning \$12,000 a year. "Cooke Training alone is responsible for my success."

\$125 a Week "Depend on me as a booster," says A. Schreck, Phoenix, Ariz. "I make over \$500 a month. Your advertisement started me to success."

\$700 in 24 Days "Thanks to \$700 in 24 days in radio," says F. G. McNabb, 7 W. 16th St., Atlanta, Ga. "I recommend your training."

Thousands of Cooke Trained Men Earn \$70 to \$200 a Week!

Send the Coupon below for full particulars of my great pay-raising training—the training that has fitted thousands of men for jobs paying \$3,500 to \$10,000 a year in Electricity

Be an ELECTRICAL EXPERT Learn at HOME in your SPARE TIME!

L. L. COOKE, Chief Engineer, Chicago Engineering Works, who has trained thousands of men for Big-Pay Jobs in Electricity.

Don't you keep on working for only \$25 or \$35 a week. Get into Electricity.—Thousands of Cooke Trained Men who knew nothing about it a short time ago are now earning \$70 to \$200 a week in the Electrical Field—and they don't work half as hard as you do. Why stick to your small pay job? Why stick to a line of work that offers no chance—no promotion—no big pay? Get into the world's greatest business. Electricity needs you. I'll show you how to do it. Get ready for the big pay job now.

Electrical Experts Are In Big Demand Even ordinary electricians—the "screw driver" kind—are making big money, but trained men—Electrical Experts who get the top salaries—are needed more now than ever before. Thousands of Cooke Trained Men easily earn \$3500 to \$10,000 a year. That's the kind of a job you want—where you can plan, and boss and supervise the work of others or go into business for yourself. Get started toward one of these big-pay jobs now. Learn to earn \$70 to \$200 a week—you can do it with Cooke Training—recommended by more than ten thousand successful graduates. Just mail the coupon below.

Employment Service and Help—No Extra Charge

I will train you for a big pay job and then help you get it without extra charge. Hundreds of Employers look to me for the electrical men they hire. Last year I placed over one thousand men at big raises in pay. Hundreds of others were promoted by their employers through the help of my Vocational Service and other hundreds went into business for themselves with the help of my special Business Training. Mail coupon for big free book which explains this service and fourteen other features, many of which cannot be had anywhere else.

Age or Lack of Experience Bars No One

You don't need experience. You don't have to be a College man. You don't have to be even a high school graduate. As Chief Engineer of this big two million dollar institution, one of the world's greatest Training Schools, I know just what training you need to make a big

success in electricity. Let me give you that training with my simplified, complete home course,—the world's famous "Cooke Training"—built on my 20 years of engineering experience with the help of nearly 50 other engineers. Learn to earn \$70 to \$200 a week—only spare time needed.

My Training Pays for Itself!

You can start earning extra money a few weeks after you start my training. I give you special instructions for doing simple electrical jobs in your spare time—show you how to get these jobs and tell you what to charge. Many of my students make as high as \$25 a week extra this way while studying. My Course more than pays its own way.

Your Satisfaction Guaranteed

I am so sure I can make you a big success in Electricity, just like I have done for the men whose pictures you see here and thousands of others who now boast my training that I will guarantee your satisfaction with a signed money-back guarantee bond. If my training doesn't satisfy you after you have finished, you get back every penny you pay me. A two million dollar institution stands back of this guarantee.

Mail Coupon NOW

Get my big free book—"The Vital Facts about Electricity." Read about the success of hundreds of other men—men who recommend this training and whose names and addresses are given in my book. Get the real dope about your opportunities in Electricity.

Don't deny yourself this chance to make big money. Get the facts NOW—Mail coupon at once for facts and my guarantee.

My Big New Electrical Book FREE!

The 1928 edition of my big book "The Vital Facts about Electricity," is just off the press! Clip coupon now for your copy—it's FREE! 112 actual pictures of Electricity at work—dozens of success stories—what you can do in this Big-Pay Profession. You'll find it all in my up-to-the-minute electrical book. Send for it today!

Wanted: Men--Women!

Make \$5,000 to \$15,000 a year as Real Estate Specialists. I made \$100,000 in less than 5 years. Learn the secret of my success. Use my scientific system. Start at home in your spare time. No capital or experience needed. Write for free book and positive proof of big success.

Men--Women--listen!

No matter who you are, where you are or what your daily task may be, here is a money-making business opportunity meriting your immediate attention.

It is an opportunity to get started in one of the biggest profit-making professions there is. And you can start right at home—in your spare time—without capital or previous experience—and build up a permanent, independent business of your own. Real estate is a business of wonderful possibilities.

It is a business in which up-and-doing men and women are making \$5,000—\$10,000—\$15,000 a year.

I started in the real estate business with no experience and less than \$5 capital, and in less than five years I made over one hundred thousand dollars.

And I have started others in the business—men and women—from 19 to 65—taught them my successful system—gave them my counsel and advice—helped them make money my way.

And what I have done for others, I will do for you—provided you are in earnest in your

desire to get ahead. To learn just how I began—to learn the secret of my success—to learn how I started others—to learn how you can use my system to break away from the rut of routine work and establish yourself in a high-class business—sign and mail the Request Blank at the bottom of this page. You will then receive—without cost or obligation—my new illustrated book, "How to Become a Real Estate Specialist," which contains my history and your opportunity. American Business Builders, Dept. 44-G, 18 East 18 St., New York.

Get Your Share Of These Big Profits

\$200 a Week

"Working on a salary of \$35 a week, my savings were few and my worries many. Now in less than seven weeks from the day I opened my office, I have made in excess of \$1,200. To no other agency do I owe the ability to carry on this business other than your System. Without it I would still be making my \$35 per week instead of around \$200 as a starter." E. K. McLENDON, Oregon.

Success Without Capital

"I have been helped a great deal with your System. I have now a new car, two new typewriters, a stenographer and a dandy office, and money in the bank, all through my own efforts and without any capital to start with." ALICE MOORE, Connecticut.

\$300,000 in Dea's

"In May, 1925, I was simply a housekeeper and stenographer. Reading your advertisement I learned for the first time of your System. Have I succeeded? This is the answer. I have sold a good many thousand dollars' worth of real estate. Have deals pending that will go beyond the \$300,000 mark. I owe all my success to your comprehensive System." Mrs. CARRIE MARSHALL, Mississippi.

\$500 a Month

"Your System opened my eyes to the possibilities in Real Estate. Since starting eight months ago, I have specialized in selling vacant lots and have earned four thousand dollars." W. H. ROBINSON, Illinois.

What Other Business Offers You Such Rich Rewards?

There is no other business in the world, that I ever heard of, that offers you all the advantages and opportunities that real estate does. Here are a few of them:

(1) Real estate is the biggest thing there is. More than half the wealth of the nation is invested in it.

(2) It is an easy business to learn. It does not take years of study like medicine, law, dentistry, pharmacy, architecture, engineering, etc.

(3) You can get started with little or no capital. I started with less than five dollars. Others have started with small sums and made big money.

(4) The real estate business is as permanent as the earth itself. It is not affected by changes in style, by human whims or caprices.

(5) Real estate is a pleasant business. No

hard, laborious work requiring unusual health or strength.

(6) It is a business open to young and old of both sexes.

(7) It pays bigger money than anything else I know of. Experienced men sometimes make \$1,000-\$5,000 in single deals—more than the average man makes in a year of hard work.

(8) There is practically no limit to the business. It is said that there are at least ten million properties for sale or exchange at all times.

(9) It is a great small-town business. One user of my system said he made more than \$1,000 a month last year in a town of only 3,000 people.

If you want to get into a business having all these advantages and opportunities, write at once for my free book, "How to Become a Real Estate Specialist."

Free Employment Service

Real estate corporations, subdivision operators, auctioneers, realty bond houses, building and loan associations, insurance companies and others requiring trained representatives (men or women) should register at once for our free employment service. Address—Business Development, Dept. 44-G, 18 East 18 St., New York.

Be a Ship's Officer

Salary Up to \$350⁰⁰
a month and expenses
Learn Navigation

See the World
in an Officer's
Uniform ~

In Only 24 Weeks
Amazingly Quick, Easy, New Method,
Endorsed by High Shipping Officials.
Many Opportunities in Our Fast
Growing Merchant Marine. Rapid Advancement.

Be an officer in Great Lakes, Coastwise or Foreign trade. See the world. Men trained in Navigation are wanted at salaries up to \$350 per month and expenses. *Advancement rapid.* It used to require years to learn Navigation. But during the war Captain Warren Sheppard was detailed by U. S. Shipping Board to devise this quicker method. *Now you can learn in only 24 weeks in your own home.* No knowledge of mathematics required. Capt. Sheppard teaches navigation from A to Z, using only simple arithmetic.

Naval and Mercantile shipping authorities endorse this method. No pupil has ever failed to pass examination for licenses. R. F. Grubaugh, 3rd Mate, S. S. Castle Point, writes: "When I took your course a few months ago I knew nothing of Navigation. Now at age of only 24 I have my license." The youngest Captain holding an unlimited Master's

license in the world, Captain Fred Higgins of S. S. Dorothy, 21 years old, was Captain Sheppard's pupil. Learn more about this opportunity for red blooded young men to qualify for big pay positions. Write for free book telling all about the course and our successful students.

Do you want to write for profit?

Not just a joke or a filler that sells at \$2, \$3 . . . but stories that thrust the will of a man or a woman or a boy to a decisive climax; stories that clench your imagination and others'; stories that make editors send fat checks. If you have any story ability at all, the Palmer Institute of Authorship can train you till you can write, regularly, for profit. Personalized, intensive training. Placing at your service the suggestions, criticisms, guidance of some of the foremost writers and photodramatists producing today. Not merely a correspondence course, but actual, constructive help . . . as if the successful novelist were reading your manuscript and suggesting, at your elbow. For details, send coupon. *No salesman will call upon you.*

Do Away With Steel And Rubber Bands

FREE to 5,000 Truss Sufferers

To the extent of 5,000 sufferers who may apply I will send, ABSOLUTELY FREE, a sufficient quantity of the Plapao to positively convince them that this is the only logical, common-sense way of treating rupture. Plapao is a highly astringent medication placed within the Plapao-Pad and being absorbed through the skin, creates a wonderful feeling of relief and at the same time tends to strengthen the weakened muscles and thus permanently close the rupture opening. The process of recovery is natural, so you'll have no use for a truss—you can throw it away forever! Old and young have testified under oath that the Plapao-Pads cured their rupture—many of them long-standing, aggravated cases—without delay from work. Patent allowed in U. S. and foreign countries. Awarded Gold Medal at Rome and Grand Prix at Paris.

Send No Money—For a sufficient quantity of the Plapao is sent without charge to enable you to give it a thorough test; you pay nothing for this trial now or ever. Write for it and full information today. Address Plapao Laboratories, Block 1427 St. Louis, Mo.

FREE Book on Deafness

LEARN *to* FLY

1000 Ambitious Young Men
WANTED

Sweeney System of Practical Airplane Mechanics

These photographs show how Sweeney students are trained by **DOING**. After thorough ground school work, under skilled instructors in the construction and repair of planes, recovering wings, tuning motor, etc., learning everything about the mechanic's work by actual practice, the student then, if he wishes, goes into the air and qualifies as a pilot under safe and experienced pilots, with double controls for actual flying. Here's the great business of the future. The National Air Transport alone has invested \$700,000 on the Kansas City air route. They are spending \$1000 a day to operate an over-night service to New York City. Ambitious men are wanted as pilots and ground mechanics. At the great **SWEENEY SCHOOL** you learn not only by doing, but you get personal instruction.

THE SWEENEY SYSTEM

is divided into two parts. First: You are thoroughly taught in the ground school. This fits you as an aviation mechanic. You can build your own plane and do anything required in aviation mechanics and construction and repairing when you have finished this work. You are thoroughly taught motors, etc., and work with thousands of dollars' worth of new material, including all types of engines—Liberty, Sturdevant, Gnomses, Hall Scott fours and sixes, etc.

Secondly: After completing this work, if you want to be a pilot, you take all the actual flying necessary to make you a competent pilot. Now when you understand that two to seven hours is all the average man needs to learn expert flying you will appreciate what this ample experience in the air under skilled men will do for you. Aviation is no longer a mystery—no longer a hazard; no, it is a

business growing greater and more important. This has been wonderfully demonstrated in the successful flights over the North Pole and also in the big part Aviation is now playing in commercial activities. Progress is rapid. More men are needed every day. You can qualify as a mechanic, or an engineer, or repair man, or builder; five men on the ground are needed for one man in the air, but if you want to become a pilot you easily master the work and can go into postal, government, or commercial work. Flyers are in demand, earning big money at fairs, taking up passengers, etc. \$5 for a 10 minute flight is pretty fine pay!

NEW SWEENEY AIR PORT

Sweeney Students are trained in the air at the great Sweeney flying field which is admitted to be one of the best and safest fields in the country. This great field is only fifteen minutes from the Sweeney Building and U. S. Post Office.

Nothing to Sell The Sweeney School is not selling any airplanes or engaged in any commercial sidelines. Strictly to the business of teaching and uses the best and most modern equipment. We are engaged in teaching real ground work and real flying, not in trying to sell you a plane. All the resources, skill, experience and reputation of the great Million Dollar Sweeney School insure that the Sweeney aviation course is the simplest, most efficient, most practical system in the world.

SEND NAME TODAY for full details of this aviation mechanical course and photographs of planes and equipment actually used; also full information as to the commercial end of flying and opportunities for young men.

High School Course in Two Years!

You Want to Earn Big Money!

And you will not be satisfied unless you earn steady promotion. But are you prepared for the job ahead of you? Do you measure up to the standard that insures success? For a more responsible position a fairly good education is necessary. To write a sensible business letter, to prepare estimates, to figure cost and to compute interest, you must have a certain amount of preparation. All this you must be able to do before you will earn promotion. Many business houses hire no men whose general knowledge is not equal to a high school course. Why? Because big business refuses to burden itself with men who are barred from promotion by the lack of elementary education.

Can You Qualify for a Better Position

We have a plan whereby you can. We can give you a complete but simplified high school course in two years, giving you all the essentials that form the foundation of practical business. It will prepare you to hold your own where competition is keen and exacting. Do not doubt your ability, but make up your mind to it and you will soon have the requirements that will bring you success and big money. **YOU CAN DO IT.**

Let us show you how to get on the road to success. It will not cost you a single working hour. Write today. It costs you nothing but a stamp.

Big Money for You as an Automobile Mechanic

These four practical books, written by five well known teachers of automobile practice, will teach you right in your own home during your leisure time just what you need to know about automobile troubles and repair. They will teach you automobile construction, maintenance and repair as experts know them and will help you to earn an expert's pay.

Practical Automobile Library: Four Books—\$1.50 in 10 days and \$2 monthly for 6 months—only \$13.50 in all!

Hundreds of question-answering diagrams—hundreds of clearly-marked illustrations—make the books plain and readily understandable. All the explanations and descriptions are clear, simple, direct. Every chapter is packed with definite, step-by-step, how-to-do-it information. Here is your opportunity to enter a big-pay field.

DRAW PICTURES OF YOUR IDEAS

Get the "Knack" In One Evening

A good picture is worth a million words. Pictures are easy for any mind to grasp QUICKLY. Every salesman, inventor, clerk, business man, professional man, should know how to make PICTURES of his ideas. And now you don't need to say, "If I could only draw, I'd show you how it works!" You CAN draw, once you learn "Perspective"! Joseph Cummings Chase will show you quickly and easily, in this simple, new way. Also how to make fine lettering, designs from flowers and animals, make posters, draw heads and faces.

Remarkable New Method

When you try to make your sketches look "real" on paper, you are bothered by ignorance of "Perspective." You wonder how to make flat surfaces "lie down"; how to make curved ones "round out." It's easy when you know the secret. Just a few lessons on "Free Hand Drawing," by Joseph Cummings Chase, the famous artist, will give you the whole trick of using "Perspective" correctly. Then you can draw mechanical objects, houses, and people in any position, just as you imagine them.

Five Days' Trial — Send No Money

You can examine Mr. Chase's remarkable course in FREE HAND DRAWING (in 12 lessons) without obligating yourself in any way. Just send address on coupon, without money. Pay postman only \$1.95 plus postage. Money back at once if desired. Easiest way to get the whole knack of drawing.

Mail the coupon today.

"I wish we had more men like him"

"I've given him two promotions in the last year and he's made good each time.

"I always feel safe in moving him up because I know that he's preparing himself to handle bigger work.

"The International Correspondence Schools keep me advised of the progress he is making and I've encouraged him to keep on. His spare-time studying certainly has made him a valuable man to this firm."

Why don't you study and get ready for promotion too? We'll be glad to help you if you will only make the start. And the way to do that is easy.

Choose the work you like best in the coupon below; then mark and mail it to the International Correspondence Schools today. This doesn't obligate you in the least, but it will bring you information that will help to start you on a successful career. This is your opportunity. Don't let it slip by.

**The
Biggest
Little
Invention
Ever
Patented**

USE IT—and

I'll Guarantee To Keep You in Razor Blades for Life!

Surprising New Invention Upsets All Established Shaving Traditions and Methods. It carries My Sensational Written Guarantee (In writing) That You Need Never Buy Blades Again—Never! Astonishing Introductory Offer Good 30 Days Only.

HOW IT WORKS

The operation of KRISS-KROSS is simplicity itself. Blade slips into holder in a jiffy. Strips all kinds of blades (except Durham).

Two hands plus 11 seconds and the trick is done. Just turn a crank and KRISS-KROSS gives your blade the keenest edge ever!

THINK of it! 365 keen, cool shaves a year from the same blade. That's what KRISS-KROSS is doing for American shavers everywhere.

This amazing invention marks such a radical advance in shaving comfort and economy that it really deserves to be called much more than a stropper. Rather it is a super stropper or blade rejuvenator. Makes hundreds of keen, quick shaves blossom where only one grew before—and prolongs the life of any-make blade for months and even years!

KRISS-KROSS stropps your blade on the diagonal just like a master barber. Eight "lucky" leather grooves do the trick in 11 seconds. Pressure decreases automatically. Nickel jig flies up to notify you when your blade is ready with the keenest cutting edge that steel can take!

Mystery Razor FREE Too!

And now for my sensational guarantee. To make new friends for KRISS-KROSS stropper, I am giving with it *free* a surprising new kind of razor. Really 3 razors in one. Instantly adjustable. Flip of the finger makes it straight, T-shape or diagonal. Exclusive feature cuts beard resistance 45%. Nothing like it ever before!

This unique razor, with 5 special-process blades, completes the outfit with which I guarantee to keep you in razor blades for life. Here's the plan: Use the razor and blades, re-newing them with KRISS-KROSS. If one of them goes back

on you I'll recondition or replace them with new ones free. No strings. No red tape. I give you my amazing guarantee in writing. It is an iron clad agreement to *Keep You in Razor Blades for Life!*

Send for Full Details

Write for information on this astonishing invention and **free** razor offer! KRISS-KROSS is never sold in stores. Send for details on this limited offer. It's even more remarkable than I can tell you in this small space. No obligation. Just clip and mail the coupon today!

AGENTS: \$350 a Month and Up

Make big money with KRISS-KROSS. Giving away **Free** razors boosts your profits amazingly. H. King made \$66 in one day. N. C. Paige made \$104 in 3 days. Others average \$350 and up to \$750 a month! SPARE-TIME workers, OFFICE and FACTORY men make \$8-\$12 extra a day showing KRISS-KROSS to friends and fellow-employees. S. Kantala made \$154 extra just working evenings 3 weeks. Get details at once. Check bottom of coupon and mail it tonight!

A GREAT BOOK FREE WITH THIS LIBRARY Special 1926 Offer

For a short time only. Every subscriber to the New Library of Machine Shop Practice will receive, absolutely free, a copy of Gardiner's Practical Foremanship—one of the greatest books on the principles and practice of modern foremanship ever written. This practical pay-raising book quickly prepares you for a foreman's job. It comes to you absolutely free with

Machine Shop Practice

9 volumes—3065 pages—3608 illustrations
(A combined home-study course and reference library)

The New Machine Shop Library is written for practical men. It gives you the best methods for every kind of machine shop work. It explains machine tools and their operation, drawing and design, tool work, reams and grinding, jigs and fixtures, automatic screw machines and their tools and all of the mathematics you will ever have to use. It is plainly written, completely illustrated—the very best kind of help to the machine shop man who wants to advance himself.

FREE Scholarship in ELECTRICITY

\$50 Electrical
Outfit FREE
to those who
enroll

Act Now At the request of U. S. Gov't, S. of E. students made the Acceptance test of this huge generating unit of the Panama Canal. **\$3200 and UP**

NEVER BEFORE has the field of electricity offered such amazing opportunities. House wiring, electric refrigeration, storage batteries and central stations, big electrical manufacturing concerns are pleading for men.

EARN \$3200 AND UP in this fascinating work. We train you with a few hours each week at home. Assist you to secure the big job. All we ask is a little of your time. Anyone can learn, whatever his previous education or experience.

STRIKINGLY EASY is the verdict of those who have examined our amazing course in Practical Electricity for home study. Special attention given

to each man's problems. No home training was ever so thorough.

\$50 WORKING OUTFIT FREE—the tools and equipment we give you to work with at home are the real thing—not toys! You do the same work while training at home that you do when you later go on the real job.

SCHOLARSHIP PRIZES TO ALL who finish the course. A free term of graduate work in residence at the famous School of Engineering of Milwaukee. Round out your training before going to work. And it's FREE, if you care to accept.

MAIL COUPON NOW for valuable book of facts. Don't delay.

\$46⁰⁰ Profit A Day Selling Amazing New Washer

"I've cleaned up better than \$175.00 a week for the last 3 months," writes Harry Jacques.

Honestly, men—here's the greatest money-making proposition offered during the past twenty years. For the first time in the history of the washing machine industry you can now sell every housewife in your community a real, efficient, entirely automatic washer that fits in any wash boiler—it is a real washing machine, easily and quickly.

And sells for only \$7.50 complete of which you pocket \$3.75 from each sale for yourself. No wonder men like Al Quigley make over \$600 a month, and Mr. Melford's earnings are more every day than he used to make in a week. Only four sales a day makes you nearly \$500 profit a month.

Agents!

Best Seller I've
Ever Seen

Sold twenty-three out of twenty-five calls. How's that for a record? My profits amounted to \$172.50.

M. E. White,
Kans.

\$7.00 Profit in
One Hour

The very first hour I went out and tried my luck, I sold two washers right in my neighborhood.

C. W. Hawley,
Oregon

\$36.50 in One
Day

Got my sample outfit at 10 A. M. yesterday, had 4 of them sold by 1 o'clock. Sold six more before I called it a day, a clean \$36.50 profit.

L. Rogers,
Minnesota

Fits in Any Wash Boiler

This amazing new invention—ends the hard work and drudgery of washday—fits in any ordinary wash boiler converting it into a real efficient washing machine in one minute. Operates wholly automatic. No electricity, gas engine or hand power needed. No moving parts to wear out or tear clothes. Thoroughly cleans and sterilizes big family washing in 30 minutes. Nothing to wear out or break. Lasts a lifetime. Sold on a money-back guarantee.

Startling Big Profits Greatest Summer Proposition Ever Offered

The Super-Automatic Washer is the greatest invention of the age. It is sweeping the country like wild-fire. Think of it—Here at last is a sure-fire, self-selling, household necessity without competition. No wonder our representatives are reaping a golden harvest, why it is now easy to earn \$7,500 to \$10,000 a year.

Enormous Demand Sells Itself

If you just stop to consider that there are more than 27 millions of housewives in the United States alone who are forced to slave and drudge over the washtub, week after week, just for the need of an inexpensive and efficient washer like the Super-Automatic, you will readily realize the positively wonderful and unlimited sales and money making possibilities for this amazing device.

FREE Sample Offer If you want to step up into the \$7,500 to \$10,000 a year class, mail the coupon now for exclusive territory and agent's low offer. No experience or capital necessary. Write for Free offer NOW.

DRAWING is a way to FORTUNE

ALI HAFED, a Persian farmer, sold his acres to go out and seek his fortune. He who bought the farm found it contained a diamond mine which made him fabulously rich. Ali Hafed overlooked the great opportunity at his door to go far afield in search of wealth—which illustrates a great truth.

Do You Like to Draw?

If you do, it is almost certain that you have talent, a talent which few possess. Then don't follow Ali Hafed's example and look further for fortune. Develop your talent—your fortune lies in your hand!

Earn \$200 to \$500 a Month and More

Present splendid opportunities in the field of illustrating never excelled. Publishers buy millions of dollars' worth of illustrations every year. Illustrating is the highest type of art and it is fascinating as well as profitable.

The Federal Course includes illustrating, cartooning, lettering, poster designing, window card illustrating, etc. No one artist is competent to give instruction in all these branches. That's why the Federal School has established its "Master Course," in which every subject is written by a specialist. No other School can offer a course nearly comparable. No other institution in the country has such an array of artists as are on the Federal Staff.

Federal Course Gets Results

Its authors include such nationally known artists as Sid Smith, Neysa McMein, Fontaine Fox, Charles Livingston Bull, Clare Briggs, Norman Rockwell and over fifty others. Exclusive lessons and drawings especially prepared by them are included in the Federal Home Study Course. They guide you from simple sketches to complex illustrations having a high market value.

Mail in the coupon below today and we will send you our free illustrated booklet, "A Road to Bigger Things."

SELL LIFE PROTECTION

Amazing New Glare Shield Banishes Fear of Night Driving

Based on Natural Principle

When you want to see an object in the direction of the sun, you shade your eyes with your hand. That's the principle of the Lee-See Glare Shield. It shades your eyes, yet permits full vision ahead.

For Open or Closed Cars

Fits any make of car, open or closed. Owner can easily install. By day, it swings up out of sight and serves as rear view mirror. Handsome ornament. No mechanism.

Night . . . a dark road . . . a sudden turn . . . a racing car swerves near with headlights blinding . . . CRASH! Now this fear is banished forever. Over 100,000 motorists now drive at night in safety, protected by a new kind of glare shield. Nothing like it on the market! Salesmen report sensational profits!

Agents Make \$30 in Ten Minutes UNIQUE DEMONSTRATION

\$140.40 sales in one day for Jack Rhanney! \$226.20 profit in a month for Darnell, working evenings only! \$82.00 profit the first week for George Smith! Over \$10.00 a day for C. D. Simpson in spare time! That's how fast this 30-second demonstration makes money for you!

You approach a driver. You hold the Lee-See Glare Shield toward the sun and look at it. The driver gets curious. You tell him what it is. "I'll take it." And no wonder—

The Most Frequent Cause of Accidents

Ask any motorist what he dreads most about night driving. "Flashing headlights." That awful moment when he gropes through dazzling light, trusting to luck that he won't hit the other car or go into the ditch. 21,000 killed last year—and statistics prove blinding headlights to be the most frequent cause of auto accidents at night.

**A FEW
DISTRICTS
STILL OPEN**

That's why the Lee-See is your big money opportunity. For you remove this worry forever. You assure drivers perfect safety, no matter how narrow the road. Based on the same principle as when your hand shades your eyes from the sun, the Lee-See removes the glare of lights—yet you see every inch of clear space ahead of you. Car owners instantly recognize its common sense prin-

ciple. That's why your sales close quick and your profits are sure.

Big Profit Season Now On

Spring and Summer is when motorists tour most. Now is your big cleanup time. Everything is in your favor. Exclusive territories to qualified agents. Every car needs the Lee-See Glare Shield and stores can't sell it. A powerful 30-second demonstration. An amazing low price, yet highest commissions. A unique automatic profit plan. And many more exclusive advantages. This may be the thing you've always wanted. The coupon brings you full details to help you make up your mind. You have everything to gain and nothing to lose by mailing it. Get out your pencil.

Tires Run 44,000 MILES

with this
Air Tight Cap
Constant
Pumping
Unnecessary

Actual photograph of a tire which, equipped with Hughes Valve Cap, has run over 44,000 miles

TIRE experts all agree that even pressure and proper inflation lengthens the life of tires. The Hughes Air-Tight Valve Cap acts as a seal on the valve, thus preventing leakage of air. This little cap does a big job perfectly. It eliminates the annoyance and bother of constant inflation, and most important of all, increases tire mileage.

Live agents are making big money distributing THE HUGHES VALVE CAP. Mr. O. S. Durr of Kansas City started selling Hughes Valve Caps in a small way. The first year he sold 14,910 sets, and his business has now reached the volume of 5,200 sets in a single month. Mr. J. A. Haines of Carey, Ohio, has sold over 12,000 sets in 5 months.

\$100 a Week and More

To live wire salesmen who want to get in the big money class, we will send our complete sales plan, explain our exclusive territory offer and send a

FREE SAMPLE

You can build a permanent, constantly increasing sales business introducing the Hughes Valve Cap. It has the endorsement of big leaders in the automobile industry such as Dodge Brothers, Goodyear Tire & Rubber Company, and Firestone Tire & Rubber Company. Sign and mail the coupon below TODAY.

Better Radio through the Earth

1851.

Buried Aerial Eliminates Trouble of Erecting Masts and Overhead Wires and Does Away with Some of the Static in the Air

THAT there are just as good radio waves traveling through the earth as can be picked out of the air, has been proved by experiments during the last two years, both with buried aeri- als and with receiving sets taken down into mines and tunnels. The radio fan with his aerial buried in the side yard likewise gets away from much of the static interference, due to electrical storms and other atmospheric disturbances.

Dr. J. Harris Rogers, inventor of under- ground and sub-sea systems of wireless signaling, has recently perfected an unusual aerial, which operates in a pit of water. The antenna is simply a copper rod, with a series of copper disks soldered to it at regular intervals. A hole is dug in the ground, partly filled with water, and the rod and plates sub- merged. A single wire from the up- per tip of the rod leads to the binding post of one end of the primary tuning coil in the receiv- ing set, and the other end of the coil is left uncon- nected, an unusual change from the ordinary practice. With this simple outfit Dr. Rogers picked up 250 send- ing stations in thirty states during a period of two weeks. The advan- tages of the under-

ground aerial are threefold—elimination of much of the static interference, ease of installation, and doing away with un- sightly overhead wires. The aerial used in his experiments was a copper rod, three feet long, with twenty-five ten-inch cop- per disks soldered at one-inch intervals. Connected to a superheterodyne, built to pick up the comparatively weak signals from small amateur stations between thir- ty-five and 100 meters, it gave a log in two weeks of testing that considerably exceeds that of the average receiving set

that has the whole broadcast band of several hundred meters to work in. Compared to the 355 meters in which broadcast stations work, the entire 250 stations separated and brought in by the copper rod and plates in their pool of water were con- densed in a band of but 65 meters. In addition to the American stations, code signals were picked up from amateurs and gov- ernment stations in the Philippines and Hawaiian islands.

Dr. Rogers, who pioneered in the theory that radio waves traveled through the ground as well as in the air, also has a transmitting aerial which has sent out signals that have been picked up in Europe. It con-

Receiving Instrument for Underwater Wireless with Which Conversations Have Been Carried On over a Distance of Two Miles

Com. J. R. Winters, Electric National Bank Bldg Washington, D.C.

Sub. Antenna Corp. 914 Clinton Chicago
Cloverleaf Int'l. Co. 2714 S. Canal St. Chicago

Left, J. Harris Rogers, Inventor of the Underground Aerial, and the Superheterodyne with Which It Was Used; Center, the Aerial in Its Water Pit, and Below, the Lead-In of a Buried Transmitting Antenna

sists of a fan-shaped series of wires laid underground in terracotta conduits.

"Once again," Dr. Rogers announced after the successful tests with the underground receiving aerial, "practical tests have demonstrated the validity of my theory that electromagnetic waves are propagated through the earth as well as through the air. I have never claimed that radio waves do not travel through the air, but I do insist that they are as readily propagated under ground and under water.

"Tests made of late with horizontal antennæ, notably those conducted by Dr. Greenleaf Pickard, further confirm the theory of earth propagation of radio waves. The signal intensities were much greater when the antenna was in a horizontal position than when it was erected perpendicularly. If energized by space waves, traveling through the air, the perpendicular position should be best, the electric forces being parallel to the earth's surface and their magnetic component, picked up by the antenna, perpendicular thereto."

Buried aerials of several types have been

tried successfully. One, which has been on the market for some months, consists of a lead-sheathed copper wire, which is buried in a hole three feet deep, 100 feet of the cable being crowded into the hole by laying it in a spiral with a few inches of well tamped dirt between turns.

Dr. Rogers' experiments with the rod and copper disks were unusual in that, instead of the three-tap loop used ordinarily with superheterodyne receivers, only a single wire led to the set and one end of the primary tuning coil was left unconnected.

The set used, designed by Brent Daniel, formerly with the radio laboratory of the bureau of standards, was a seven-tube outfit, with a novel system of long extension rods for turning the condenser dials, in order to eliminate the capacity effect of the human body.

The use of superheterodynes for short-wave work, while comparatively unknown in this country, is quite common abroad. Such sets in London pick up the Pittsburgh rebroadcast regularly.

Rotating Balls in Rear Propel This Queer Craft, the Projecting Fins Acting like Paddles; to Steer, One Ball Is Stopped and the Rig Pivots Around like a Tractor

MOTORBOAT ON HOLLOW BALLS IS STEERED LIKE TRACTOR

Floating on three hollow balls, each four feet in diameter, and propelled by the revolutions of the two rear spheres, which are lined with fins, an odd craft was tested recently in Los Angeles harbor. The rotating balls were turned by a small automobile engine and to steer the boat, one of the balls was stopped while the other was allowed to turn, pivoting the craft about as a tractor is steered.

INDIAN BONES FOUND INCASED IN COPPER ARMOR 1946

Incased in armor of beaten-copper plates, the skeleton of what is believed to have been an Indian chief has been unearthed near Berea, Ky. The find is regarded as one of the most important of this nature ever made in that part of the country, and additional relics that may shed light on a little known chapter of Indian history are being sought by Prof. W. G. Burroughs, of Berea college, who found the skeleton. It was buried in one of the black shale "knobs," or blunt foothills, near the site of a prehistoric fort. The teeth were well preserved and worn flat, evidently due to eating dry corn and gritty material that sometimes fell into the Indians' food. Holes in the copper plates showed where thongs had been tied to hold the pieces together. Prof. Burroughs believes the armor to be thou-

sands of years old and that the copper originally came from the Lake Superior region. Its use was known to the Indians long before the white men came.

RADIO-PICTURE SERVICE OVER ATLANTIC IS STARTED 1983

Pilgrims made another journey to the United States from England a short time ago, but the trip consumed only minutes as compared with the historic voyage. A picture of the Pilgrims' society dinner, being held in London, was flashed by radio to a New York newspaper in one hour and forty-five minutes, inaugurating commercial wireless-picture service between the two countries. If static had not interfered with perfect transmission, the time taken would have been much less, as radio illustrations have been sent in only twenty minutes in earlier tests.

Important Steps in Locomotive Progress Since the Days When Stagecoaches on Rails Were Pulled by Rattling Wood Burners; Electric Power Necessitated Radical Changes in Engine Styles Which Have Passed through a Continual Evolution

1926 1917 1906 1905 1903 1901 1900 1899 1893 1880 1874 1860 1851 1840

A black and white illustration of a woman with her hair in an updo, wearing a dark jacket. She is looking through a magnifying glass at a plant specimen in a display case. The display case is a wooden cabinet with several glass-fronted drawers, each containing a different pressed plant specimen. On the table in front of her are several more pressed plant specimens, including a large, dark, curved leaf and a small, dark, star-shaped plant. The background is simple, with some faint text visible at the top.

Mrs. Mary H. Stoddard and Part of Her Collection of Sea Weeds Gathered
along Vacation Beaches

GATHERING FLOWERS OF SEA
WOMAN'S SUMMER HOBBY, 1928.

Various kinds of sea weeds are gathered and mounted by a New York woman, who has found that the waters of some of the ocean beaches are little-known wonderlands filled with many interesting and beautiful forms of plant life. She has an extensive collection of the weeds.

A large, ornate, dark-colored ceremonial headdress or mask, possibly made of wood or metal, featuring intricate carvings and a wide, flared base. The central part of the mask has a face-like appearance with large, circular eyes and a wide, open mouth. The base is decorated with a pattern of small, light-colored dots or beads. The overall shape is cylindrical with a flared bottom.

Evidence of the splendor of the royal tables in Peru, before the days of Columbus, has been found in a cup of gold, ten inches high and bearing a portrait in hammered relief. It is believed to have belonged to the service of one of the Inca kings and is thought to antedate the time of the Spanish conquest by 1,000 years or more. Like other relics of the period, it shows the high degree of skill which these early Americans had attained in the art of gold beating. They also displayed exceptional skill as silversmiths, potters and engineers.

Vanity Case Serves as Grip for Handle and Is in Convenient Position for Use When Umbrella Is Folded Up

VANITY CASE AND UMBRELLA COMBINED IN ONE

Folding into a compact bundle when not in use as a protector, an umbrella introduced in Germany contains a compartment for powder, rouge, lipstick and other things carried in the vanity case. The arrangement saves bothering with an extra article and is useful both on clear and stormy days.

CHARIOT RACE BEHIND MOTORS THRILLS FESTIVAL CROWDS

Lurching behind roaring motorcycles, one-man chariots in a thrilling race furnished spectators at a London fair all the excitement of a contest among daring

riders plus the allurements of the speed duel made famous in Roman days. Teamwork between the man on the cycle and the "driver" in the chariot was needed, especially on the curves when the two-wheeled vehicles skidded and bounced, and probably would have overturned but for the fact that the occupants leaned far to one side to maintain balance. Riders had to make allowance for their trailers as they shot past one another.

SEEK CURE FOR TUBERCULOSIS 1949 BY VACCINATION

Promise of immunity from tuberculosis by vaccination is seen in the results of experiments conducted by Prof. Albert Calmette, of the Pasteur Institute, and of Dr. H. Selter, of the University of Königsberg. Since June, 1924, more than 4,500 children, all living in close proximity to the disease, have been vaccinated by Prof. Calmette with a weakened strain of microbe which had been cultivated for a number of years. Published records of 423 of the subjects showed that, in the first six months after vaccination, approximately one-third had been exposed but not one had died from tuberculosis, although thirty had died from other causes. Unvaccinated children, of tuberculous parents and living under similar conditions, showed a mortality of twenty-four per cent in three years. Dr. Selter has experimented with virulent living microbes on the theory that inoculation with these would produce real immunity. He vaccinated nine children who were exposed to tuberculosis in their home surroundings with these virulent cultures. None of them suffered any ill effects.

Mysteries of the Sea

Book of Dead ^{Wreck} Ships Records Unexplained Tragedies Which Still
Trap Vessels and Crews Despite Radio Protection

By J. EARLE MILLER

TWENTY-FIVE seamen, asleep in their berths, were wiped out almost instantly recently when an exploding cargo of high-test gasoline swept a column of fire through their tank ship, lying at a Texas gulf-port dock.

Had the accident happened at sea, another unexplained mystery would have been added to the thousands in the "Book of Dead Ships," for so swiftly did the fire spread that the sleeping sailors had no chance to even leave their bunks, and the officers in their cabins barely got away with their lives because of the near-by dock. At sea there would have been no time to launch a lifeboat or send a distress signal by radio.

The list of dead ships contains many that burned at sea, but, until the invention of the tanker, with its cargo of highly inflammable gasoline or oil, it seldom happened that a ship burned so fast the crew could not escape.

There are more than 300 ships lost every year, but, since the invention of radio, the toll that enters the book of unexplained mysteries has grown less and less. For a great modern steel steamer to be swallowed up by the sea so completely that not a life belt, a bit of shattered wood-

work, or any other marker floats away to tell the tale, seems impossible, but it continues to happen occasionally despite all the safeguards that can be placed around navigation.

The unexplained disappearance of the naval collier "Cyclops" during the war remains one of the most notable and amazing occurrences in all the history of the sea. A huge steel ship, big enough to carry 10,000 tons of cargo, manned by an efficient naval crew, equipped with a high-powered radio set, the latest thing in lifeboats, scores of life preservers and other devices, the "Cyclops" apparently went down so suddenly that no call for help could be sent, no boats launched, life preservers thrown over the side, and so quickly and completely, it left no wreckage behind.

For more than seven years the disappearance puzzled the brains of navy chiefs, and then one day, a few months ago, a sister ship, of the same size and construction, did an amazing thing that cleared up, in most minds at least, the "Cyclops" loss. The sister ship, heavily loaded, as was the "Cyclops," with cargo disposed in the holds near either end, most easily reached by loading derricks, start-

ed bucking and bending in a fairly calm sea, but was rushed to port and saved. The experts decided the "Cyclops," lifted up amidships by a wave, broke her back, the break snapping the wireless aerial in half, and the two ends plunging to the bottom before any of the scores of crew and passengers had a chance to get away.

There are many such mysteries which may never be explained. The steamer "Orleanian," of 2,293 tons, sailed from New York for Malta on November 3, 1915, and was never heard from again. Her path led across the Atlantic, always a stormy place in winter, but one of the busiest trade routes in the world, with dozens of ships within radio call at any time. Yet the "Orleanian," put to sea with a crew of thirty-six, vanished utterly from the sea, and left not so much as a life buoy behind to tell of her loss.

In the underwriters' room at Lloyds, in London, the "Lutine's" bell tolled once

to proclaim another tragedy, the silent insurance men gathered round to hear the "Orleanian" announced as overdue, and she was entered in the "Book of Dead Ships."

In that same year the "Marowijne" sailed away from the coast of Yucatan, on August 13, on her thirteenth voyage. Date and number of the trip are carefully entered in the book of the lost, for sailor superstition cannot overlook such a combination as that. One day out, and the "Marowijne" was spoken by another ship. From that day to this, no one has ever seen her or any part of her. Ninety-six souls aboard, including twenty-eight passengers, went down with the ship.

Thousands of ships have been swallowed by the sea, but one of the strangest tales in all maritime records is that of the three ships that were swallowed by the land! All three disappeared in virtually the same spot, a graveyard of ships which

now is well marked with warning buoys. The first was the tug "Taurus," engaged in aiding a stranded steamer off the jetty at the mouth of the Mississippi. The tug was straining at the tow-line, when a cross current whirled her around and she filled and sank. Another tug saved the steamer, but no trace of the tug was ever found. Quicksands had swallowed her complete.

Years later the oil tanker "Catonia," 330 feet long with 3,000 tons of crude oil from Tampico, punched a hole in her bottom on some hidden rock and was run aground in what appeared to be a safe spot in shallow water. The officers and crew went ashore to summon help to make repairs and refloat the vessel. They returned the next day in time to see the last of their ship disappearing into the ground. Soundings taken a few months later showed her far beneath the surface of the treacherous sands, sealed for all eternity. Next came the "Theodore

The Black-Robed Clerk in the Announcer's Pulpit at Lloyds, in London, Tolling the "Lutine" Bell to Announce Another Vessel Missing at Sea

Ashore on the Virginia Coast. This Danish Steamer Was Battered for Days by Heavy Seas, While the Coast Guards Stood By, Helpless to Aid Until the Storm Had Abated

Weems," steaming along in a fog, to crash head on into the "Heredia." The damaged "Weems" ran for shallow water, only to fall foul of the quicksands, sinking out of sight, but not before the crew had time to reach land.

Bits of wreckage, marked life preservers, messages in bottles, many things have helped clear up some of the mysteries of the sea, but the fate which takes a ship down without leaving any trace behind is still a puzzle. One of the most heroic chapters in the book of the dead ships is the story of the Japanese submarine "No. 6," lost in Hiroshima bay on April 18, 1910, with all on board, a crew of fourteen men. The ill-fated submarine will ever live in history because her commander, Lieut. Sakuma, used his last strength, as he lay dying in the steel death trap, to urge the navy not to lose confidence in submarines, and to apologize to his emperor for losing the ship.

In the library of congress in Washington there is a copy, in Japanese, of this famous letter, with a translation beside it, a unique case of the American government paying tribute to the heroism of a foreign naval officer.

"Words of apology fail me for having sunk his majesty's submarine 'No. 6,'

Lieut. Sakuma began in the letter which was found with him when the submarine was raised a few days later. "My subordinates," he continued, "are killed by my fault, but it is with pride that I inform you that the crew to a man discharged their duties as sailors with the utmost coolness until their dying moments.

"We now sacrifice our lives for the sake of our country, but my fear is that the disaster will affect the future development of submarines. It is therefore my hope that nothing will daunt your determination to study the submarine until it is a perfect machine, absolutely reliable. We can then die without regret."

He then went on to describe the accident, how the sluice that admitted water for diving was wedged so it could not be closed, how the crew had tried to hold back the sea with their hands and failed, and how the rising water put out the electric generator and extinguished all the lights as they reached bottom.

"It was at 10:00 a.m., on the 18th inst., that the boat sank," he continued. "Surrounded by poisonous gas, the crew strove to pump out the water. The crew are now wet and it is extremely cold. It is my opinion that men embarking in submarines must possess the qualities of cool-

ness and nerve and must be extremely painstaking; they must be brave and daring in the handling of the boat. People may laugh at this opinion in view of my failure, but the statement is true.

"We have worked hard to pump out the water, but the boat is still in the same position. It is now twelve o'clock.

"The crew of a submarine should be selected from the bravest, the coolest, or they will be of little use in time of crises—in such as we are now. My brave men are doing their best."

He added a personal plea to the emperor that the families of the crew be provided for, told where to find his will, extended his respects to a long list of fellow officers, and then wrote:

"I thought I could blow out gasoline, but I am intoxicated with it—Capt. Makano—it is now 12:40 p.m."

On that unfinished sentence the letter ends. At ten o'clock in the morning they went to the bottom, and before one in the afternoon the pen fell from his fingers.

In the custom offices of busy ports, where the fate of the lost ships is preserved as part of the records, strange stories of the sea are hidden under the dry routine of official reports. The greatest tragedies—the ships that just disappear never to be heard from again—get the least mention, because there is so little to say beyond the brief "not since reported." But when the sea is foiled and gives up the men who become almost resigned to the inevitability of death, the case is dif-

ferent. Take the loss of the "Hildegard," a lumber barkentine, out of Brunswick, Ga., with a cargo for Havana, Cuba. On Dec. 17, 1916, in a raging gale, she got off her course and during the night ran afoul of a reef, whose usual marking of breaking waves was hidden by the towering seas. The ship was wedged fast and apparently doomed. Then tugs appeared out of the night and dragged her off.

The sea was cheated, but only for a time. Six months later, repaired and seaworthy, the barkentine had landed a cargo at Havre, France, and sailed away from there on July 7, 1917, for St. Thomas, in the Virgin islands. A few miles out from the coast, the lookout sighted the long streak left by a German periscope, and before he had time to shout a warning, the submarine broke the surface, a gun popped into view and the German commander megaphoned orders for the helpless sailing ship to stop.

A boat put off from the submarine and a boarding party placed bombs in the barkentine's hold, then returned to the submarine after ordering the crew of eight not to leave the doomed ship.

A few minutes later the "Hildegard" was torn from stem to stern by a terrific explosion, but at that moment, with almost equal suddenness, a wall of fog rolled down and hid the sinking ship from the gunners' crew on the submarine. Under this thick shroud, the crew launched a lifeboat and rowed toward the coast, being picked up later by an allied patrol.

But for Wireless the Loss of This Japanese Ship, 400 Miles off Boston, Would Have Been an Unsolved Mystery; the Radio Brought Aid Too Late, and the Entire Crew Was Lost

Aerial Advertising Kites

BURNING BIRDS FOR TORCHES

The romance of artificial lighting has been traced back to the days when the early Shetland islanders fashioned a torch lamp by sticking wick into the throat of a fat stormy petrel and to other crude beginnings by Dr. Walter Hough of the National Museum. His researches reveal that animals have played an important part in furnishing light for man. In the tropics of America, natives once built cages for a species of large luminous beetles and used them as lanterns, while the Indians off the northwest coast of America burn a fat little fish for lighting purposes in much the same way as the Shetland islanders did the stormy petrel. Whales and seals have made the largest contribution in supplying lamp fuel. Up to 1859, when petroleum was discovered in large quantities, they furnished the major part of the world's lamp oil. An important step in the development of artificial lighting was the solution of the problem of draft for lamps. This is credited to a Swiss engineer named Argand in 1782. George Washington had some of the Argand lamps at Mount Vernon, and these are now included in the collections of the museum.

CHECKERS IN SLOTTED BOARD STAY IN WHILE TRAVELING

Travelers who like to play checkers can do so with ease on a slotted board that holds the men in place and folds flat over them when the game is ended, or interrupted. The whole assembly is so small that it can be carried in the pocket and takes up but small space in the traveling bag.

Emil Kahn,

Test to Illustrate the Lifting Power of the Big Kites Included in Commander Byrd's Arctic Equipment

MAN-CARRYING KITES TO LIFT ARCTIC EXPLORERS

Kites so large that they will support a man have been included in the equipment carried by Lieut. Commander R. E. Byrd on his expedition to the Arctic. By means of a special steadying device, the kites can be held sufficiently still for hoisting a radio aerial on them, or, should a survey be necessary, a man can be lifted by the kites, saving the use of an airplane.

LIGHT STEEL FOR DWELLINGS WITHSTANDS HEAVY WINDS

Structural steel, light in weight but said to be stronger proportionally than any yet produced, is now being manufactured for dwellings. It can be used just as heavy beams are employed in skyscrapers, and is especially adapted to the construction of roofs and floors to afford resistance against winds, earthquakes and fires. Units are prepared in sizes and shapes suitable for rapid and easy construction.

barge but in three minutes, the tug had pulled it up at such an angle that it was emptied of water and, in another ten minutes, was tied at its wharf. At first glance, the boat resembles a floating greenhouse. The shelter deck is inclosed by glass. Inside is a curved hump, the housing for the caterpillar. Below this, the hull is like that of other river craft except that the two ends have the same shape. Power is now supplied from a gasoline motor, but this is to be supplanted by a Diesel-electric engine, burning crude oil. The tug used in the test was thirty feet long, twelve feet wide and developed fifty horsepower, displaced only eighteen inches of water and was said to be efficient at a depth of only three feet. Larger tugs are contemplated up to 1,000 horsepower, with a view to extending a type of through and in-

CATERPILLAR TANK AS TUGBOAT RUNS IN SHALLOW WATER

Extensive development of inland water transportation is promised from a new type of tugboat for river barges. Its outstanding feature is the method of propulsion. Instead of wheels or propellers, a chain of perforated cups runs under the hull at a point where the keel would be. It is like the caterpillar drive of war tanks and tractors. The tug's chief claim to service is that it will operate in shallow water, thus utilizing thousands of miles of inland streams now unsuitable for transportation purposes. Interesting tests with one of these boats were held recently on the Mississippi river. An empty barge was pushed and pulled in rapidly changing directions. A large wave from a passing steamer sunk the

intermediate river-freight service over the more than 25,000 navigable streams in the United States. The development will begin with the fourteen major rivers of the Mississippi river valley, it was announced. Barges would be of a standard width of sixteen feet and up to 100 feet long. The smallest, fifty feet in length, are designed to hold a load equivalent to that carried by a railroad freight car.

Balloon-Tired Bicycle for Display

BICYCLE ADVERTISES BALLOON TIRES

To advertise its product, an English firm equipped a "freak" bicycle with balloon tires. Their size was accentuated by having an ordinary bicycle ridden beside the special. Although the large tires required more propelling power, they proved to be very efficient shock absorbers.

LAND CRUISES TO PROVIDE OCEAN LINER LUXURIES

Courtesy Raymond and Whitecomb Co.

Views inside One of the Special Land-Cruise Cars. Showing Gymnasium, Recreation and Dressing Rooms

There is a new kind of travel called a land cruise. It is the last word in luxurious railway journeying. By its complete contrast to the old days it brings to mind the early stages of American railroading. Forty years ago, to travel from New York to California meant an arduous trip in badly lighted cars, without a diner, with only cold water to wash with—and that requiring pumping by hand. The land cruise of today is a voyage in specially built and luxurious cars affording every comfort of the modern ocean liner. The train consists of nine all-steel cars; a recreation car with gymnasium, locker room, shower bath, entertainment and dance hall (seating forty-nine persons), a motion-picture machine, a radio receiving set, a barber shop and a library lounge; an observation car with a spacious platform; a specially constructed sleeping car, containing real beds and private baths; other cars with drawing rooms, compartments and improved Pullman sections with permanent partitions; as well as a dining and baggage car. The cruise train, in trips of from two to six weeks, will visit

places which the traveler ordinarily has to omit or to reach at the cost of days of waiting for connections and of great discomfort. Trips are planned to cover the northwest, the central Rockies, the southwest, California, the Canadian Rockies and Alaska.

GLASS MADE WITHOUT SAND FROM MYSTERY METAL 1934

Chemists at Cornell university have discovered a way of making sandless glass by using a compound of germanium, a rare newly discovered metal, as a substitute for the usual silica. The process indicates a possible practical application of the metal, which scientists hitherto have found no use for. It is a flaky crystalline substance, hard and extremely brittle, and is worth many dollars a gram. The metal is extracted from zinc oxide and scientists are studying its compounds in the belief that the element has medicinal properties that may be helpful to mankind. It is now being produced in relatively large quantities at Cornell, about a gram of it being obtained from a pound of raw material.

Prof. L. M. Dennis

Forty-Six Acres of Molten Lava Rising Up from the Pit of Hawaii's Great Volcano, with a Fire Fountain in Action on the Right; Note the Curious, Irregular Lava Streams

He Lives on the Edge of a Volcano

Prof. Jaggar Risks Life in Hawaii to Study Eruptions in the Hope That He May Be Able to Predict Them

IT is probable that the recent spectacular eruption of the volcano Mauna Loa, which rocked the largest of the Hawaiian islands, is of far greater significance than is supposed, because of the fact that the phenomenon was observed by men who have devoted their lives to the study of volcanoes.

These men, headed by the foremost authority on volcanoes in the world, Prof. T. A. Jaggar, were in the unique position of being fully equipped and on the ground before the eruption began.

To the layman the appeal of the latest outburst on the picturesque side of this peak, 13,675 feet high, lies in the gigantic fountains of lava, estimated to be 150 to 200 feet high, which leaped from the newly formed crater, and the terrific river of molten lava which flowed, slowly at first and then swiftly, down to the sea, enveloping and consuming everything in its path. The sight was one of the most awe-inspiring in years.

The first eruption was not at the summit of the mountain, but at a point about

12,000 feet above sea level. After several hours of quiet, following the initial outbreak, additional lava flows appeared at five or six points in the mountain side. These outbursts finally converged into two main streams which began moving slowly down the slope. The initial motion of this fiery flood was slow owing to the fact that contact with the earth cooled the lava and retarded it. After the "track" had been laid, in some cases 1,800 feet wide, the speed increased from a few rods an hour to two or more miles.

Aviators flew over the devastated region while the lava progressed, and reported that the heat was so intense they had to keep at an elevation of 3,000 feet. Prof. Jaggar was among the most venturesome of the observers, making observations at points which involved much personal danger. The scientist's insatiable desire for first-hand information recalls his earlier work of drilling holes in the lava to determine the temperatures below. He had a well rig and a steam engine and was doing the job in regular well-driller fashion. At

break of
Mauna Loa
Was So Bad
Aerial Pic-
tures Could
Not Be Taken

that time he was hoping to find means of harnessing the heat of the volcano for commercial purposes, as has been done in Italy. He still cherishes that hope.

Among Prof. Jaggar's other objectives in studying a great eruption are determination of the composition of the gases that are given off; the temperatures of the lava; the frequency and violence of the earthquakes (which sometimes total hundreds daily); the extent of the earth tilts and fluctuations of lava.

While all of these things mean little to the layman, they are of the utmost importance to the scientist who has given more than twenty years of his life, fourteen on this island, to a first-hand study of volcanoes. Previous to settling down on the brink of Kilauea, he made numerous expeditions to volcanoes, after their eruption had started. While these investigations yielded some valuable information, it was as nothing compared with data he has been able to acquire while living year in and year out near the edge of a live crater.

As a result of his studies, Prof. Jaggar has definitely established the fact that eruptions in the two Hawaiian volcanoes—and presumably in all or most other volcanoes—occur in more or less definite cycles. In some cases the periods between eruptions may be a few months in length, while in other cases it may be a few years or even a century. The riddle he hopes to solve is, "How accurately can these eruptions be predicted," and why is the cycle of nine years which Mauna Loa, for example, maintained since 1823, now being badly broken up. The last eruption of this volcano was in 1924. Prof.

Jaggar believes that there never is an "effect" without a cause. In other words no volcano ever blows up without preceding events taking place in definite sequence. He has proved further that if we will use instruments sufficiently delicate and if we are patient enough in their use, we can definitely record these "preceding events."

A volcano blowing off as Mauna Loa has been doing of late is nothing more or less than a gigantic tea kettle boiling over, the professor seeks to explain in non-technical language. But the simile is only superficially correct because there are so many other forces and factors at work. The nature of the gases, the pressures they are under, the amount of water if any that contributes this increasing pressure, the gradual shrinking and consequent cracking of the "teapot"—these are some of the many factors that complicate the situation but do not baffle the scientists.

There is a good deal of ground for the belief held by many who have studied Mauna Loa's actions at short range, that the great volcano has entered a new era in its age-long history. The recent repeated petulant eruptions may be interpreted either as the approach of a senile old age—if such a term may be applied to a volcano—or the preparation for a gigantic upheaval the like of which has never taken place in the whole 150 years of Mauna Loa's recorded history.

It would seem that Prof. Jaggar does not incline to the latter belief for he and Mrs. Jaggar have their home on the very brink of fiery Kilauea and times without number earthquakes have shaken the house foundations until their dwelling rocked and careened on its base.

SALVAGING BURNT MONEY 163

It was the morning before Christmas, but the man who appeared at the treasury department in Washington was the picture of dejection. He carried two tin boxes filled with cinders of \$1,000 in bills, laid away to pay off a mortgage. His house had burned down, destroying everything he had. But the government salvage experts set to work, and that afternoon paid him a large portion of the sum in crisp new bills, all that they had been able to identify from the ashes. This is a sample of the service performed by this interesting department of the treasury.

The salvagers daily receive from 100 to 200

packages, ranging from envelopes and tin cans to large wooden boxes filled with cinders of hard, charred lumps, which they must examine closely for possible identification as currency. Little bits of engraving or serial numbers often give clues to the bills. The fragments are pasted on thin sheets of tissue paper to reproduce the original bill as closely as possible, and a record is kept of its number and payment so that the same bill will not be redeemed twice. Affidavits accompanying the burned money must also be

checked and verified. Sometimes nothing but fine ashes is sent in and the experts can make nothing of them. One man raked up all the ashes in his furnace and shipped them in a huge box. He thought that the government could identify the money by chemical analysis but that was impossible. Another declared that he had sent in the ashes of \$600, but only \$100 could be identified, and that amount was paid.

Clay-Pigeon Gun in Operation on Shooting Grounds; Hunters Get Practice Where Real Game Is Often Found

NEW CLAY-PIGEON THROWER DEVELOPS HUNTER'S AIM

Practice in shooting at clay targets can now be conducted under typical hunting conditions with the aid of a special kind of thrower introduced in England. It is of portable size so that it can be easily carried to places where real birds are found in season and the gunner can employ the same tactics as he would in approaching live game.

T. Ito of the Field Museum Staff Drinking from Ostrich-Egg Cup He Put Together

ANCIENT OSTRICH EGG MENDED BY EXPERT

What the old story-book legend declares "all the king's horses and all the king's men" could not do by way of repairing "Humpty Dumpty," has been accomplished by an expert of the Field museum of natural history in assembling the fragments of an ostrich egg believed to be some 6,000 years old. It was found in the ancient ruins of Kish.

One of the Giants of the Chicago Dog Show, "Cuno Krebs," a Great Dane Weighing 176 Pounds

DOG EIGHT HANDS HIGH WEIGHS AS MUCH AS MAN

"Cuno Krebs," a Great Dane exhibited at a recent dog show in Chicago, is thirty-three and one-half inches high at the shoulders and weighs 176 pounds, typical of the best specimens of the breed which is similar in some respects to the German boarhound. The Great Danes sometimes attain a height of more than three feet and weigh nearly 200 pounds.

SUNKEN SHIPS SEALED BY ICE TO AID IN SALVAGE

In salvage operations, attempts are often made to float sunken vessels by sealing them tightly, pumping out the water and thus raising them to the surface. The sealing is frequently a difficult matter, and to aid in this step, a German inventor has devised a submarine refrigeration plant by which a vessel can be coated with a sheet of ice over the damaged part so that the hole is plugged and the pumps can force out the water. Cables lower the plant to the scene of the operations and cooling liquids are forced down through pipe lines from above. The pipes are placed over the aperture in such a way that, in the case of a metal ship, the hull is cooled at the same time and the ice ad-

heres firmly to the plates. In case the damage consists of a holed bottom, and is inaccessible, a quantity of highly cooled oil is introduced into the vessel, causing a coating of ice to form below the oil layer, thus sealing the ship. It is asserted that this process, by cooling the vessel's hull and causing contraction, helps to loosen it from the silt and mud of the sea floor. Sunken ships are a constant menace to navigators and fishermen, and they also frequently cause breaks in cable lines. The British admiralty recently published a set of charts, showing by red dots, the approximate positions of sunken ships. The coast lines appeared to have been spattered with a brush full of red ink, so numerous were the wrecks.

READY-CALKED PIPE SAVES TIME

Lead, jute and a self-tightening arrangement are inserted in pipe of the familiar bell-and-spigot type at the foundry, saving such work in the trench. This is said to permit laying the pipe about three times as fast as is possible with ordinary kinds, and at a saving of approximately one-half the labor. The spigot end has two rings of indentations so placed that the joint materials are forced into them by calking, and they render a blow-out almost impossible. Tests have shown that this style of pipe will resist heavy pressure and can be laid by unskilled workers. It is interchangeable with standard pipe and fittings.

Blazing Trails for the Map Makers

Geodetic Survey's Reconnaissance Engineers Scout Country Preparing Preliminary Surveys under Unusual Hardships

By DONALD EDWARD KEYHOE

Reconnaissance Engineer, Coast and

JUST off a northern Missouri road, in a lonely spot, half hidden by the driving snow of a heavy blizzard, stood a small tent, curiously out of place in such bleak surroundings. Beside the tent, and driven as close as possible to break the bitter wind, rested a mud-spattered truck, its contents carefully covered with a tarpaulin. But for the stormy night there might have been passers-by to wonder at this strange camp, but the few who came that way hurried on unseeing, their minds on the cozy firesides awaiting them at home. The unusual license tag on the truck might have solved the riddle for some, but there would have been many to whom the word "geodetic" would only have served to increase the mystery.

Few people realize the discomforts which frequently are experienced by the reconnaissance engineers of the coast and geodetic survey in the field work which takes them over all parts of the United States. When the closing hour comes for the average business man, he is free to go home, to mingle with his friends and to amuse himself in a dozen ways. When

the failing light of day renders further observations impossible for the geodetic engineer, his work is only partly finished. He must select a stopping place, pitch his tent, and prepare for a lonely night, with only his thoughts for company.

Living in this manner is not unpleasant in fair weather, but the surveyor who camps out in the winter months is not to be envied. The Missouri camp scene just described is no flight of fancy, but is a true picture of conditions recently encountered by J. S. Bilby, of the coast and geodetic survey. The blizzard which set in one night just after he had made his camp would have caused most people to emulate or even surpass the Arabs in rolling up their tents and stealing away. Yet by an ingenious expedient Mr. Bilby made himself quite comfortable, according to his own statement.

"The wind was blowing a gale," reads his report, "and it became so cold that my two-burner gasoline stove would not heat my tent. I took an ordinary five-gallon motor-oil can and filled it nearly full of water. Leaving off the cap, I placed the

geodetic survey.

Shore Camp in the Everglades Built on Stilts as Protection against Alligators and Other Crawling Things

can on the stove and waited until the water began boiling, when I turned down the blaze so that the temperature hung just under the mark. Then I spread a tarpaulin over my cot so that it came down to the floor on all sides. By putting a lighted lantern underneath I managed to keep my bed warm, while my hot-water system warmed the tent. It was fine. If the weather gets any colder, I'll just add another can of water."

The reconnaissance engineer who works alone like this, marking triangulation stations ahead of the main surveying party, must be proficient in several matters, in

Food Cache of Survey Party in the Northwest, Elevated on a Platform as Protection against Animals

addition to having the technical knowledge required of him. He must be an automobile mechanic; he must be able to pitch and break camp in a few minutes, under the most trying conditions of weather; he must cook well enough to satisfy his own tastes, and he must be a man who has initiative and decision in emergencies, for he is almost entirely "on his own" in this work.

At best, such a life becomes lonely at times. Mr. Bilby, who has had years of experience in geodetic work, admits this.

"Especially," he adds, "when the wind is howling through the trees, and the rain is pattering down on the tent, and you

know there's little chance of anyone dropping by. But the radio has made a big difference for me. Now my aerial pole goes up just as soon as I pitch my tent, and after I've cooked supper I hook up the set and tune in a concert somewhere. Speaking of radio, I've had some odd things happen in the more outlying parts of the country.

"One evening I had stopped at a desolate spot in Montana and had rigged up my set so I could get in touch with civilization. While I was listening to an orchestra, I heard a noise near the tent and looked up to see a small boy staring at me. I hadn't an idea where he came from, but there he was. He asked me what I was doing. Rather surprised, I told him I was listening on the radio.

"Radio?" he repeated. "What's that?"

"When I saw that he wasn't joking, I explained the apparatus briefly and handed him the ear-phones. He listened with eyes popping out and a scared look on his face.

"Where's this a'comin' from?" he demanded, pulling off the headset.

"I told him it was Kansas City, but I saw the name didn't mean anything to him, so I explained it was a large place several hundreds of miles south, in the state of Missouri. That was as far as I got. He backed away and was out of the door before I could say another word. I thought perhaps he was half-witted, and I didn't expect to see him again, but in about an hour a wagon drove up. There was the boy, with his father and mother and the rest of the family, which was over half a dozen children. The boy had run all the way home—wherever that was—to tell them about the music that came out of the air, and they

hadn't wasted any time in getting back to see if he was telling the truth. Incredible as it seems, none of them had ever heard of such a thing as the radio. That shows how far out in the 'wilds' we get some times. I tuned in stations all over the country for them, and they never left until the last one signed off.

"Another time, down in Mississippi, I had a funny experience. I struck camp late one afternoon, by chance picking a lot near a negro

To Save Time in Transporting Lumber in Mountain Country, Engineers Bend Three Trees Together, After Lopping Off the Branches, to Form a High Tripod on Which a Signal Station Is Mounted, Visible to the Surveyors Miles Away; Below, Breakfast on a Mountain Top

church about half a mile from a small town. There were two plantation boys watching me as I put up my tent and antenna, but I didn't pay much attention to them. After supper I was listening to a program while I got ready to make out my daily reports, when I heard a commotion in the lot outside. I glanced out and saw some hundred and fifty negroes drive into the lot with old buggies and wagons, but I supposed they were going on into

sets and passed them around. It wasn't long before that Virginny reel music had an effect. In a few minutes the phones were handed on, but the first listeners began making their own music, and they had some mighty good voices, too. That started the whole crowd going, and in a little while they were singing and dancing away, with the radio half-forgotten. There was a show all right, but they put it on themselves. It lasted until after midnight.

Lacking a Dog Team, the Surveying Party in Alaska Furnishes Its Own Motive Power to Drag the Instruments and Supplies over a Snow-Capped Plateau Far from Civilization

the church so I went back to my reports. In a little while one of them put his head in at the door.

"'We all waiting fo' de show to begin,' he announced.

"Then it dawned on me. The two boys who had been watching me put up my tent had mistaken me for one of those old-time medicine men who draw crowds by a little act or two before trying to sell their patent medicines, tonics or pills. They had evidently spread the word far and wide, for the crowd was getting bigger all the time. I didn't want to disappoint them, for they were good-natured, easy-going plantation folk, so I did the best I could. I happened to know that it was 'Old Fiddlers' Night' at Jefferson City, so I tuned in and moved the set out to the door. Then I split the two head-

"Radio has made the coast and geodetic survey known more than it used to be. A few years ago people were always asking what the name meant, but now I often find they know us pretty well, from talks they've heard on the air. One lecture on mountain building which was broadcast from Washington was the means of getting me a fine dinner. I had stopped at a farmhouse to make inquiries and the farmer noticed my 'geodetic' tag. He mentioned this talk he'd heard, and when I said it must have been given by the chief of my division, Major Bowie, he became so interested that he made me stay to dinner to answer his questions. However, that wasn't unwelcome after eating my own cooking for so long."

An extract from one of Mr. Bilby's old reports reading, "lost half a day on ac-

A Barrel Wagon, Used as a Sled Substitute, Has Wheels Made by Sticking Rods through the Barrel Centers

count of a storm," gives an interesting sidelight on this typical engineer, when it is explained that the storm was later found to be a true-to-form Kansas tornado, which scooped up his tent and blew it clear into the next county.

The work of the survey in mapping Alaska and fixing the boundaries has taken the engineers over winter trails in the far north,

Surveyors in the Tropics Are Molested by Bee Swarms, Making a Net Necessary to Protect the Face; Below, the Northernmost Point on the Line Dividing Alaska and Canada

down unknown rivers, and into land where, probably, no white man had penetrated before. They have met the Canadian surveyors on the shores of the Arctic ocean east of Point Barrow, the northernmost spot under the American flag, and there placed the Stars and Stripes beside that of the Canadian survey.

Electric Cabinet Adjusted over Sleeper, and End View Showing Switch and Arrangement of Lights Inside; Black Shield Protects the Eyes from Direct Light

LIGHT BATH WHILE SLEEPING KEEPS INVENTOR WELL

A "sun bath" every night while sleeping in his electric-light bed, keeps the inventor, a Washington man, in vigorous health, free from colds and pulmonary troubles, he declares. His body is exposed directly to the beneficial rays, the bulbs being arranged so that even distribution is effected, and the glow is concentrated by means of reflectors around the bed, while the eyes are shielded from direct light.

KEY TO MARS MYSTERY IS SOUGHT THIS FALL

Astronomers are planning to make the best of the opportunity late this summer to learn more of the mysteries of Mars, when the planet approaches nearer the earth than it will in another fifty years. Special studies are to be made at Lowell observatory at Flagstaff, Ariz., where, by means of delicate instruments, Dr. W. W. Co-blentz of the bureau of standards determined that the Martian temperatures

range from far below zero to the balmy weather of spring. Further information concerning these temperatures, and not so much the question as to whether or not there is life on Mars, will be the chief objective of the study. If man does exist on the planet, scientists believe that he is specially equipped to survive under the rapid changes of temperature there. In six hours, extremes from freezing to halfway to the boiling point of water are believed to be the lot of the Martians, if there are such creatures. They possibly have wings for quick locomotion or their feet are shovel-shaped so that they can dig into earth for protection during cold spells. If there is vegetation, it is supposed to be like the mosses or lichens that thrive in cold weather on the earth.

COPPER BANDSTAND ROOF IMPROVES TONE

Constructed of limestone and copper, an outdoor memorial bandstand, erected in a St. Louis park at a cost of \$50,000, has been planned for the best musical effects as well as for ornament. It stands on a concrete foundation and the roof and ceiling, which are of copper, are intended to give added resonance to the tones of the instruments without impairing their quality or muffling them. The floor is of a composition material and the pillars and railings of stone. The stand is placed on a mound entirely surrounded by water to afford

unobstructed passage for the music.

CHILDREN'S BARBER SHOP IS FITTED UP LIKE CIRCUS

Looking at the Peep Show While Waiting: Interior of the Shop and Patrons

Having their hair cut holds little terror for children taken to a shop in a mid-western city. It has been fitted up as a sort of playroom with chairs resembling animals of various kinds, and twelve little cabinet theaters on the opposite side of the room, one across from each chair, so that the occupant will have something interesting to watch while the barber is at work. While waiting their turn, the children can enjoy a peep show in the outer room of the shop as well as animal pictures on the walls. Keeping them outside the hair-cutting room until they are to be waited upon also prevents the fear that sometimes arises from watching other children having their hair cut. Shades on the ceiling lights, hangings, upholstery and other features of the shop carry out the idea of a circus tent.

BUZZARD WITH BELL ON NECK SHOT IN GEORGIA

For years a belled buzzard has been reported from time to time in such widely different parts of the country that most persons had come to regard it as a myth. But evidently the tales were well founded

for recently a farmer, while hunting near Comer, Ga., brought down a huge buzzard which had a small cowbell tied to its neck by a piece of wire that had nearly rusted in two. On the bell was this inscription, crudely carved but plainly legible: "Joel Mine, Leonville—1882." There is a town of that name in Louisiana, but it has not yet been definitely established that the buzzard was first caught and tagged there. Considering the rapidity with which these birds fly and their long lives, it is thought possible that the buzzard originally may have come from some more distant place and has probably been flying with the bell about its neck for forty-four years.

Taking Temperature of the Coal Pile

HEAT GAUGE FOR COAL PILES REDUCES FIRE HAZARD

Costly fires sometimes occur when piles of coal becomes ignited from spontaneous combustion. To reduce the danger from this source, a special thermometer equipment has been devised. It has three dials for telling the temperature at different depths. The instrument is inserted in the coal by means of a rod extension.

LOUD SPEAKER IN COURTROOM AIDS JURY SELECTION

Enabling the judge to hear responses to questions propounded to prospective jurors in a New York courtroom, a loud

speaker and microphone proved effective against outside noises. The speaker was placed near the ceiling in the center and the microphone on the judge's bench.

REBUILDING OF OLD IRONSIDES RECALLS DEEP MYSTERY

Plans for the restoration of the historic "Constitution" recall many absorbing tales about the famous frigate and have reopened a perplexing mystery—what became of the original Andrew Jackson figurehead that pointed "Old Ironsides" about the seas for forty years? The Jackson figurehead now at the naval academy at Annapolis is said not to be the original which was mutilated in Boston in 1834, for it represents Jackson with the left hand thrust into his coat at the breast. An old engraving showing the "Constitution" moored between the "Columbus" and the "Independence" in Boston harbor, shows that Jackson carried his hat in the left hand. No record can be found as to when the original decoration, the fourth to be attached to the ship, was removed and replaced with a different model. But a certain test awaits the first of the two figures if it ever is found. Inspired by a wave of political antagonism that suddenly had arisen against Jackson and as a "daredevil" adventure, Charles Dewey, a young man from Boston, during a rain and wind-storm on the night of July 2, 1834, sawed off a part of the head. He later delivered the fragment to the secretary of the navy and told President Jackson what he had done. Jackson was more amused than angered, declaring that the figure never had been a good likeness from the first. The position of the cut, historians declare,

will establish the authenticity of any figurehead produced as the original. Secretary Wilbur has asked that students of naval history and others assist by supplying any authentic information possible concerning the ship's ornament. The first one attached was an effigy of Hercules, completed with the vessel in 1797. This was knocked off or damaged beyond repair during the war with the Tripoli pirates. It has been suggested that this be adopted as the figurehead for the restored "Constitution."

DESERT CITY IS MOVED BY TRUCKS IN SINGLE DAY

When a City Takes to the Road; Moving the Town of Lone Wolf, Calif., Fourteen Miles by Motor Truck through the Desert; Small Houses Were Placed on Trailers

Modern engineering skill has made possible the moving of a city over fourteen miles of unbroken trails on the Mohave desert in southern California. The new town, Lone Wolf, is on the plateau 5,000 feet above sea level. Formerly located one-half mile off the main desert highway, it was decided to move the city, which is used as a health resort, to a more secluded and desirable location. Accordingly, a site was purchased, trails blazed, material ordered and 250 men recruited. The transportation of 260 tons of houses, wagons, cots, machinery, trees and other such items was accomplished in twenty-four hours. Ninety-eight five and ten-ton

trucks with several trailers were used for the actual moving of the old city. Because of the rough desert dirt roads, it was necessary to block the springs solid to prevent the houses from rocking too violently as they rode over ridges.

**CIGARS ARE CUT FOR SMOKING
AND HAVE DRAFT HOLE**

Cigars that do not need cutting or hitting off at the end before being smoked are furnished by a London dealer. The tips are sheared off after manufacture and a pin about two inches long, headed with a top similar in color to the tobacco leaf,

is pushed in. This does not detract from the appearance of the cigar and all the customer has to do is to pull out the pin and light up without fussing with the weed to get it to draw well.

Using the Practice "Hole," and Close View Showing Tabs and Flexible Center

STUDY MYSTERIES OF NERVES BY ELECTRIC TESTS 1824

By application of various electrical principles, scientists are endeavoring to learn more of the nature of the nervous system, sometimes regarded as a sort of storage battery. In one laboratory, the current of a nerve of the body has been picked up by a wireless receiving apparatus; in another, electric fish are being studied for what light they may shed on the human mystery. A Japanese scientist is reported to have discovered that a nerve will not conduct impulses unless surrounded by an abundant supply of oxygen, indicating why some persons think and react more rapidly than others whose blood is deficient in oxygen. While impulses going along a nerve fiber are said to be accompanied by electric changes similar to those that attend the passage of current along a wire, the nerve current suffers no loss in intensity, or voltage drop. This indicates, scientists believe, that the nerves have a way of regenerating the current, as does the amplifying apparatus installed in long distance telephone systems.

PRACTICE GOLF PUTTS INDOORS WITH FLEXIBLE "HOLE"

Skill in putting is half the game of golf in the opinion of some players, and to develop proficiency in this phase of the sport, a round pad, lined with tin tabs to trap the ball, permits practice indoors or on the links. Its inner diameter is about the same as that of a regulation hole, and as the ball rolls over the rim, it is stopped by the raised projections on the other side. The tabs may be bent to any desired angle and the entire unit may be carried in the pocket or in the golf bag.

AUTO ELEVATOR RAISED BY AIR ELIMINATES PIT 1719

Operated by the air-compressor system, which is usually a part of the regular equipment at automobile service stations, an elevator simplifies the task of greasing or repairing cars. It takes the place of the pit and makes a long trestle platform unnecessary.

Car Hoisted on Compressed-Air Elevator Is Accessible to Repair Men and Quickly Lowered

SUBSTANCE HARD AS DIAMOND MADE FROM TUNGSTEN 1759

Promising to replace diamonds in glass cutting, polishing and other operations, a substance just as hard has been prepared at a steelworks in Prussia, according to reports. It is formed by melting a mixture of tungsten and tungsten carbide in an electric furnace at a temperature of 3,000 degrees Centigrade. News of the discovery coincides with reports that carbon has been melted by a German chemist. The preparation of fused or molten carbon is the first step toward the making of synthetic diamonds.

Curtain Attached to Grooved Strip and Close View of Molding Section Showing Slot

CURTAINS HUNG FROM MOLDING INSTEAD OF POLE

Special molding, with a groove in which short lengths of dowel stock are inserted to hold screweyes, for attaching curtains, has been devised as a substitute for poles. It is readily applied to any casing, may also be used for suspending coat hangers, eliminates the need of special fixtures and cannot fall down. An added feature is that it does not collect dust.

RESTING IMPROVES "TIRED" ROADS

Concrete pavements, like people, get tired and are benefited by periods of rest, tests at the university of Maryland have shown. When vehicles pass over a section of cement road, it is deflected to a certain degree so that the paving is set into a sort of wavelike motion. Where the traffic is heavy, this movement may be repeated many hundreds

For Rainy Days, a Pair of Long Spats Keep Mud from Stockings and Are Warm

SPATS PROTECT LADIES' HOSE

Close-fitting spats, extra-long and of attractive material, have been found practical on rainy days to keep spots from women's light-colored stockings. Besides acting as a shield, they are warm and comfortable and can be pulled on and off as easily as socks.

of times an hour. The experiments have shown that, after continued rapid application of the load, the normal elasticity of the concrete is overcome, the "fatigue" limit is reached, and the material cracks. If long rests were given, however, the substance regained its ability to resist the applied forces. The tests were given under conditions that duplicated as nearly as possible actual road factors. Scientists are watching with considerable interest the application of a new kind of cement which is said to develop greater strength in concrete within twenty-four hours, than the ordinary Portland variety does in twenty-eight days. If the substance fulfills its promise, it would be possible to build a road with it one day and open it to traffic the next. Further studies are being conducted to determine more fully the properties of this cement.

POWER OF NIAGARA DOES WORK OF FORTY-FIVE MILLION MEN

In all some 1,467,000 horsepower, equivalent to the energy of 45,000,000 able-bodied men, is derived from the hydroelectric plants run by Niagara Falls. By far the larger share is taken from the Canadian side, where four big stations, developing 110,000 to 600,000 horsepower each, are located. The largest was recently completed at an expenditure of nearly \$40,000,000 after eight years of work. About ninety-five per cent of the flow of the river passes over the Horseshoe fall, which has a width of 2,600 feet as against 1,000 feet for the American fall. In building the last big power station, engineers tapped the river above the falls, thus increasing the drop of the water to the turbines to 300 feet.

BRICK IMITATED IN STUCCO
1532 WITH GRILL MARKER

Brick Pattern, Hinged

Imitated in Stucco; the Grill Cross Section of Wall and Marker for Corners

Stucco and plaster can be marked to resemble brick, block or stone by using a grill with members arranged in a pattern like those of mortar joints. Hinges are provided for using the marker around corners, and the pieces that produce the joint lines are flat on the upper surface and triangular or rounded on the underside. In practice, the usual first coat of cement is placed on the lath and the marker imbedded in the material. The finish coat is then applied and the form removed, leaving grooves corresponding to those in masonry.

TELEPHONE ON FREIGHT TRAIN REDUCES NUMBER OF STOPS

By means of a telephone connecting the caboose and the cab of a freight train with seventy-three cars, the engineer and conductor of an eastern line held conversation recently, saving the need for hand signals and speeding the progress of the train. As they were pulling out of the yards, the conductor notified the engineer that a car-repair man was riding in the caboose and would get off at the east end of the yard and close the switch when the train was on the main track. This saved slowing up, and later the engineer notified the conductor that, if conditions were satisfactory with regard to the train,

he would not stop for water at the next station. Permission to proceed was given, sparing another delay. The wires were strung over the tops of the cars.

PLANE WITH TEN PROPELLERS TO HOLD HUNDRED PERSONS

What will probably be the largest airplane in the world is now under construction at an eastern plant. It will have ten propellers, as many engines and will weigh 100,000 pounds and is intended to carry 100 passengers. Patents have been granted on the design of the cabin. It is arranged with two tiers of seats at right angles to a center aisle. Only seven of the motors will be used in actual flight. The plane is to be constructed to fly in all sorts of weather, the builder declares, and is expected to prove practical from a commercial standpoint because of its enormous capacity. Other novel features include a system whereby the plane can receive fuel while in flight.

SMALL MOTOR-TRACTOR CRANE LIFTS HEAVY WEIGHTS

Capable of lifting heavy weights and quickly manipulated, a small motor-driven crane is attached to a tractor unit for easy changes of position and access to places that could not be reached with larger equipment. The apparatus has been given successful tests in Germany where it is being used in manufacturing plants, on docks and for similar tasks.

FAMOUS HISTORIC GEMS ARE REPRODUCED IN CRYSTAL

Exact reproductions of the world's most famous diamonds have been made of rock crystal and semiprecious stones, fused to reproduce the proper shade of each gem. The collection took eight years to complete. The immense labor involved in preparing these replicas calls attention to the amount of work necessary to shape, cut and polish the real stones.

The diamond is an unattractive bit, resembling a piece of alum or sugar crystal when it is first picked from the mine clay. To prepare it for the jeweler's display case, it must be cleaved or cut, shaped and polished. The first process is done with what is technically known as the diamond saw. It cuts through the grain and the process requires great care and constant watch for imperfections which would throw the saw off and spoil the prospects for a perfect diamond. The difference in weight between the rough stone and the finished gem varies from a third to sixty per cent. From one of the diamond mines 6,000,000 loads of blue ground, weighing 1,600 pounds each, were removed and only one-fourth of a carat in diamonds found, showing that the stones are often exceedingly rare even in the rough. Heavy taxes are also partly responsible for high diamond prices.

COUNTRY CLUB IS BUILT ON ROOF OF SKYSCRAPER

Looking Down on the
Roof-Top Gymnasium, and Some
of the Workers Using Equipment
during a Noon Recreation Period

Nearly all the facilities of a modern country club are provided for the workers of a New York firm in an outdoor gymnasium on top of the building. The equipment includes a running track, handball court, miniature golf course, steam room, hot and cold showers, sun baths and massaging quarters, besides rowing machines and other exercising paraphernalia. Instruction is given by competent teachers, and the head of the firm declares that, since the system was installed, there has been a marked increase in the efficiency of the workers and great improvement in their health.

CATTLE THROWN INTO OCEAN TO SAVE SHIP

As a result of the forced drowning of a number of cattle during the voyage of a British ship recently, regulations have been passed requiring that vessels carry

ing cattle or other animals to British ports be provided with suitable mechanical killing instruments to insure humane slaughter. The stock ship "Manchester Producer" had just left Halifax when it ran into a furious storm. On the upper deck were more than 300 cattle in ordinary pens. For four days it was impossible to feed or water the animals properly. To relieve their sufferings, the boat was steered slightly out of its course so that the craft would not ship such heavy seas. The move proved disastrous, for the steering gear broke under the strain and the vessel drifted entirely at the mercy of the ocean. To keep the boat from sinking, the cattle had to be driven into the sea. Several days later the ship was picked up, virtually a derelict.

RIDING SAFER THAN WALKING ROAD COMMITTEE FINDS

Regulation of pedestrian traffic deserves greater attention, according to a report of a committee to the second national conference on street and highway safety. The investigators found that automobile drivers have made considerable progress in learning what to expect from other drivers and how to avoid collisions, but no such improvement has been achieved when autoists and pedestrians meet. Incompetence in automobile operating was held due to ignorance of regulations and customs, insufficient strength or quickness in controlling the vehicle, defects of sight or hearing, defective intelligence, or temperamental or emotional inability to do the right thing in a sudden emergency.

EGGS EXAMINED WITH CAMERA FOR ESTABLISHING GRADES

Department of agriculture photographers use an interesting method for reproducing in colors the inside of eggs in connection with grading. The picture is taken in front of a lantern-slide projector; then the camera lens is removed and the artist colors the pictures to make exact reproductions of the inside of the eggs as seen through the empty camera. Lithographs of the colored drawings are made later and distributed among egg candlers throughout the country to aid them in classifying eggs uniformly. According to government figures, some 5,000,000 farms produce eggs, so that the establishment of definite grades is of great importance.

Curtain on Roller Rings, and Close View of Unit Showing Position of the Bearings

CURTAIN RINGS WITH ROLLERS SLIDE EASILY ON ROD

For hanging shower-bath and other curtains, rings with two rollers that slide along the rod, eliminate sticking and the necessity of pulling with risk of tearing the fabric. They are easily attached and operate on almost any size or kind of smooth rod.

MOVING PEAK IN SWITZERLAND SLIPS SIX INCHES YEARLY

Daily measurements of the Motte d'Arbino, a peak 5,500 feet high in Switzerland, show that its summit is shifting horizontally at the rate of four inches a year and that it has sunk more than six inches during the last twelve months. The top of the mountain, covering an area of 100,000 square feet, has become dangerously undermined, observers report, and declare that, should the underlying rocks give way, the entire plateau would crash into the valley. Precautions already have been taken to prevent loss of life in case this should happen. Records of the peak's movements have been kept since 1888.

Making Motion Pictures of a Tulip's Growth and Blossoming; under Favorable Conditions the Development Is Extremely Regular

PLANTS GROW ON SCHEDULE SLOW MOVIES SHOW

Under proper conditions and using artificial light, plants can be grown on schedule, slow-motion pictures taken by an eastern firm have shown. It was discovered that some plants progressed from tight buds to a full bloom in exactly forty-five minutes. The study was considered valuable as promising an adaptation of the system to "forcing" plant life

HOW TO TELL TIME BY STARS AT ANY SEASON OF YEAR

If the stars in the northern sky are visible, you can set your watch by them within fifteen minutes of the correct time and without the use of complicated tables. The Pole star is considered as the center of a huge clock and the pointers of the Dipper, the hour hand. The numeral six will be below the Pole star and twelve above. Taking the time as indicated by the Dipper's pointers, you add to that figure the number of months that have elapsed since the first of January to the nearest quarter month. The resulting sum is doubled and subtracted from sixteen and a quarter. If the result is more than sixteen and a quarter, subtract it from forty and a quarter. The answer is

the time in hours after noon. For instance it is late September and the pointers of the "sky clock" correspond to the position of the hour hand at seven o'clock. Eight and three-fourths months have elapsed since New Year's day. This is added to seven, making fifteen and three quarters. Double this is thirty-one and one-half. Subtracting from forty and one quarter gives eight and three quarters or 8:45 p.m.

OLD NEWSPAPERS BLEACHED AND USED AGAIN

Old newspapers are reported to be transformed into sheets as white as the original so that they can be used again by a

bleaching process that has been developed at Cornell university. The method does not greatly change the nature of the pulp, it is said, although there is a loss of about ten per cent, and the cost is a fraction of a cent higher per pound than the present price of newsprint due largely to the high cost of the papers and the limited scale of the experiments. A method for removing ink from book and magazine paper has been in use for some time, but similar processes have been considered too expensive or work too great changes in the pulp to make them practical for application to newspapers.

TRAY IS FITTED TO ARMCHAIR FOR WRITING OR READING

Easily attached to the arm of an upholstered chair, a small tray is found useful for holding

for holding writing or reading materials, teacups or smoking set. It can be tipped to various angles and is held in place by a weighted band which slips over the arm of the chair. The

same arrangement is provided with a work basket for sewing materials.

By LIEUT. H. R. THURBER, U. S. N.

"SQUADRON flag's heading this way, sir; flank speed pennant flying," cried the executive officer of the destroyer.

"All right," the captain shouted back. "Tail in behind her. We're going over to join the troop transports. Look out for the convoy-formation signal."

It was the beginning of a peace-time war problem in which the forces of the army and navy were about to clash. A day of tropical April sunshine had passed without event as we steamed toward the southwest, the troop transports snuggling close under the protecting wings of our squad-

ron. Around the battleship was drawn another cordon of cruisers and destroyers.

As the shadows of the Pacific night closed in, a flapping line of flags shot up to the yardarm of the flagship. "Zigzag plan five." The signal dropped and the ships of the convoy began their "zig," sliding from one course to another with precision, like well-drilled squads of marching soldiers on parade.

All the officers were on the bridge after a hasty dinner, watching, toward the west, the last lingering light sifting up from below the horizon into the dusk. A sig-

The Destroyer's Main Weapon of Offense, a Battery of Three Torpedo Tubes with a Torpedo, Just Dropped by One, Splashing into the Sea Bound for an Enemy Ship

nal from the flagship, "Cease zigzag," was executed. The fleet forged ahead silently, bulky, lightless, toward its landfall.

"Hello! There's the army!" exclaimed the captain, as a faint fan of white whisked over the sky there almost dead ahead. Then, another. Searchlights.

"Hm'mm. Shouldn't use searchlights, I should say," commented the captain. "What's time?"

"Ten-fifty, sir."

"Very obliging of them. Another check on our navigation. We're right on time. At eleven, we change speed

As we crept into the black gloom of the inner bay, a sudden, soaking rain squall blotted out all sight of the splotchy shore line and swept away visual contact with the convoy.

"We've about arrived, captain," said the executive officer from the other side of the bridge. Even as he spoke, I heard a smothered clinking of anchor chains easing out through hawsepipes. Before that, there had been no sound except the hum of our fireroom blowers.

"Troop ships are on station, sir."

"Very well," replied the captain. "We take up a continuous patrol round them

Half Black in the Shadow of the Plane's Wing, the Long, Slim, Polished Tube of a Torpedo Drops Swiftly from Its Cradle beneath the Airplane to Dive and Speed Away under Water

to five knots. North-coast battleships leave us then, and we slide into the bay with our soldier boys."

We could just see the black-towered silhouettes of the battleships as they started away from formation, heading for their bombardment station ten miles off the coast. But in a few minutes they vanished from view. Only once did we have an inkling as to their exact whereabouts, at eleven-thirty, when there was the faint sound of a deep-voiced whistle to the westward, and running lights of one ship flashed on, then out.

"Must have had a collision, or a jammed rudder," the executive officer said.

Follow the ship ahead, distance about five hundred yards."

Out to seaward, a light flared in the sky, fluttered downward, snuffed out. Another one! After the last, continued blackness.

"Enemy airplanes dropping flares. Or, perhaps, better still, star shells from the ships, simulating gunfire," hazarded the captain. "Bombardment started, theoretically, you know, at midnight to prepare the way for disembarking troops."

I tried to picture the actual firing of the ships, as they steamed slowly back and forth out there offshore, splitting the night with long red belches from the great

A Night Version of "Painted Ships on a Painted Ocean." Looking like an Animated Cubist Painting, Marks the Celebration of the Battle Fleet When It Returns after Maneuvers; at the Right Is a Forty-Knot Destroyer under Full Steam

The Mosquito Squadron of Destroyers Laying Down a Smoke Screen to Conceal the Arrival of the Battle Fleet from Discovery by the Enemy

guns and sharp flashes from the secondary batteries. Shells chugging, landing with flaming bursts on their objectives, hurling crumpled masses of rails and buildings high into the night air, blasting great holes in the terrain, setting on fire the cane fields. Anti-aircraft batteries, spitting fiery tongues at enemy bombers and torpedo planes which were endeavoring to attain the exact position to launch their missiles, while fighting planes of both forces were in a whirling, flaming melee around them. Destroyers were lashing the waters for lurking submarines.

At three o'clock, by the beams sweeping afar from the enemy searchlights, I saw our troops disembarking from the transports, and shortly after heard the staccato put-put of the launches moving with their tows through the darkness, shore-bound. An anxious half hour passed. Then, I heard firing, saw sharp, stinging flashes of small arms and artillery. It lasted for about three minutes, then ceased abruptly, leaving us to the stillness of the waters lapping past our sides and the eerie quiet which comes to the tropical shades just before dawn.

Cautiously, the faint light of the new

day began filtering through the graying heavens. Troops began pouring from the transports. String after string of loaded boats moved in line abreast toward the beach, which was beginning to show its thin, white surf line between the irregular clumps of foliage above it and the hazy water below.

Our squadron, on signal, formed column and commenced a simulated bombardment to cover the beach landing. By four-thirty, the reflected light of the morning sun peeped over the southward-sloping chain of mountains to the east. The transports weighed anchor and began moving to seaward.

"There come the planes!" came a cry from the fire-control tower. There was swift activity on deck. The anti-aircraft and machine-gun crews, donning gas masks, swung their gun sights toward the approaching targets. The men at the four-inch battery wheeled their gun muzzles upward.

The small "flight" streamed over two of the retreating transports, then swooped down to attack the last of the shore-bound troop boats. Bombs and ammunition expended, they sped away. The bell from the radio room rang and the operator shouted up the tube: "Mississippi is torpedoed by a sub; judged sunk." Through my binoculars I could see the first wave of boats from the battleship naval regiments—equipped with radio and artillery—starting toward the outer point. The minesweepers were moving inshore, taking in tow the emptied boats of the marine landing force.

"Here's another flight!" the executive officer sang out. He called them off as he examined them through his glasses. "Nine bombers par-

Behind the Smoke Screen
the First-Line Ships Ma-
neuver in Secrecy

alleling the beach. Eighteen mixed planes, including five—no, six—bombers, headed for the transports."

The radio bell rang again. "Report from southwest landing. 'Wyoming' judged torpedoed—speed slowed. 'Shawmut' bombed and judged sunk. Two cruisers and one sub judged sunk by gunfire. Success of troop landing in doubt."

"Hot and heavy, what?" remarked the captain. "Well, I think our troops are all set. Hello! Look there!"

A large flight of bombers, guarded by a swarm of fighting planes had emerged from the mist to the

mander when to lift the barrage from our batteries, and when to concentrate on the next belt. I looked at my watch—nine o'clock. Events had moved swiftly. The radio bell again.

"Two subs out of the game off north coast, captain. 'Arizona' got one, and the 'Farragut' and three other destroyers caught the 'R-19' coming up. 'Scotched' her—she hoisted the flag 'Sail'—surrendered."

There ensued an alert search for submarines in the vicinity of the transports, while the battleships moved in closer to the beach, continuing their simulated bombardment in advancing barrages, disrupting the enemy's resistance.

From the "Seattle" the chief umpires sent a message to the radio room. The captain himself answered the tube. "Signal from chief umpires, sir. Cease present exercises."

"Secure from general quarters," said the captain. "War's over."

Later the umpires decided that the attack would have resulted in the capture and occupation of the land position.

MOVIES NOT HARMFUL TO EYES

If you can read, write or do other work without tiring your eyes, there is no harm in going to the movies, specialists in eye diseases say. Tests with 150 persons showed that those who suffered eye fatigue after watching a motion-picture film, also became tired when doing other work that affected the vision, so that the movies were not responsible for the trouble.

PLANE HAS BRAKES ON WHEELS FOR QUICK LANDING

View of Stinson's Latest Airplane. Features of Which Are the Roomy and Comfortable Cabin for Passengers and the Wheel Brakes; Chains Also Aid in Landing on Snow and Ice

Greater safety and comfort are promised in a cabin-type airplane devised by Eddie Stinson, veteran pilot. It will carry four or five passengers and is said to have such stability that it will straighten out in a flying position when the pilot removes his hands and feet from the controls and throttles the motor. A mechanic is not needed at the "hop-off," as the plane has an electric self-starter, nor is it necessary to use chock blocks to keep the plane still while the engine is warming up, for there are brakes on both wheels. These hold the craft to the ground and are released by the pilot when he gets ready to start. The brakes will also permit landing in small areas and chains on the wheels will prevent sliding long distances even if the ground were covered with ice and snow. Another feature is the arrangement of the exhaust from the motor. It has been carried to a point below the cabin to decrease the noise and allow passengers to converse without having to shout or make signs. Plush carpeting, provision for smokers and a heating system for comfort

in cold weather are additional conveniences of the cabin. The pilot is so placed that he can see the ground directly beneath him, the wheels of the landing gear and also the ailerons and stabilizer. The plane is propelled by a 200-horsepower motor, develops a high speed of 125 miles an hour, 105 miles for cruising and a landing speed of forty-five miles. Besides the passengers, it can carry 300 pounds of mail or freight, seventy-five gallons of gasoline and seven and one-half gallons of oil. It is twenty-eight feet long and has a span of thirty-three feet nine inches.

RADIO-TUBE BASE MATERIAL 1817 ALSO USED FOR ANVILS

Tougher than cast iron, almost as hard as a diamond, moisture-proof and capable of being machined accurately, isolantite, a recently prepared material, is being used not only for radio-tube bases, and spark plugs for airplanes but for the small anvils employed in automatic can-making machines. There it withstands acid flux,

flame, melted solder and hammering for an average performance of 100 days. Other materials, glass, metal and stone last but a day or so at the most. This substance is prepared from a powder so fine that, if a cupful of it is poured out, only a small amount reaches the floor, the rest floats around in the air. It is molded into rods or blocks under pressure and under the action of a chemical that causes the minute grains to stick together. Pressure alone will not produce this effect. While the blocks are still soft, they are cut to the required length and the pieces finished to the desired form, just as metal units are worked up, then fired in a gas furnace. Since the material contains no water, it can be exposed directly to the flames. When a temperature of about 2,800 degrees Fahrenheit is reached, the material is held at this point for sixty seconds, during which it changes its character, becoming suddenly harder than any other substance except diamond. It can be threaded both inside and outside, and is said to have even greater strength than metal, so that an iron screw would be stripped rather than the isolantite threads. If a dish of it is dropped twenty feet to a concrete floor, it may chip the cement, but the article itself will not break.

ENGINE SMOKESTACKS SHRINK AS BOILERS GROW 1825

The short smokestack of the larger types of locomotives is conspicuous as compared with the stacks of some of the older but smaller engines. The reason for this is simple. Clearance at overhead crossings has remained a fixed factor and the boilers in the big locomotives have been built up almost to the limit, so that it is impossible to erect long stacks on top of them. When electric trolleys appeared, some engineers predicted that they would speedily supplant steam on every line in the country, but the locomotive has steadily persisted, and now individual gasoline-driven cars are on the rails, modeled after the automobile rather than after the trolley.

Steelworkers Pitting Their Skill against the Elements to Shorten an Auto Road; Crooked River Canyon Viaduct

CANYON BRIDGED WITH STEEL FOR AUTO HIGHWAY

By the old road on the Dallas-California highway, in Oregon, it was six miles down and up the other side of the Crooked river canyon, a difficult stretch for autos or teams. Travelers are now spared this descent and climb by a steel bridge, said to be the highest vehicle viaduct in the world, that has been built across the canyon. It is 351 feet high, 360 feet long and cost \$125,000. Because of the loose nature of the rock, the edges of the cliff had to be dug back twenty-five feet to afford a secure foundation, and the high winds blowing through the canyon made the erection of steel difficult and hazardous. To support the bridge before the last units were in place, four hydraulic jacks, two on each side, with a pull of 160 tons per pair, were used. They were held by large concrete deadmen, and the bridge was kept from swaying by guy cables.

¶Thirty-one towns in the United States have been named after Franklin.

ELEVEN-MILE-LONG RADIO WAVES TO CIRCLE GLOBE

Broadcasting on an 18,000-meter wavelength will be done from the giant station near Rugby, England. The towers are over 800 feet high and some 800 miles of wire has been buried six inches below the surface of the ground near the masts. The tremendous electrical activity set up around the station when the transmitter is in operation is represented in diagram on the opposite page. It is seen that the waves do not ripple evenly from the broadcasting aerial but radiate from the magnetic field between the antenna and the earth. The actual transmitting area lies between the ground wire and the exposed aerial hung between the masts. Moving at the approximate speed of light, more than 186,000 miles a second, the waves arise from every point in the field and

are not just from one, as had to be indicated in the sketch. They are spherical in character, centered on the aerial and while generally enlarging, they have a constantly secondary back-and-forth expansion and contraction, alternately leaping ahead and falling behind the general advance. Opposing electric and magnetic forces on the aerial, throw out electromagnetic waves, the wireless waves. The positive charge produces the crests and the negative, the downward surge.

SMALL DYNAMO IN FLASHLIGHT REPLACES BATTERY

A pistol-shaped flashlight, introduced in England, requires no batteries, as current is supplied from a tiny dynamo operated by pressing a trigger. It has a

conveniently modeled grip for handy use and is easily carried in the pocket.

Close View of Lamp, Showing Clamp, Joint and Switch, and Its Uses on Auto Trip

AUTO LIGHT HELD BY CLAMP TURNS ON SWIVEL

When trouble occurs while traveling by auto at night, an extension electric light with a strong clamp is found useful. The spring clasp can be fastened to almost any object and is covered with rubber to prevent scratching smooth surfaces. A reflector of nickelplated brass affords a strong, clear light, while a swivel joint permits turning the lamp in any direction. It also serves as a spotlight or may be used for lighting the tent or camping space when illumination is needed.

EIGHTY-YEAR-OLD RARE STAMP VALUED AT TEN THOUSAND

Worth only five cents at the time of its issue but now valued at \$10,000, a rare old stamp of the Alexandria, Va., post office of 1846 has just been acquired by an eastern collector. It is the third of its kind found so far. Apparently, the issue was on sale for not more than a week. The stamp is circular in form, slightly larger than a quarter dollar and is printed, not engraved. The government had not yet begun to issue stamps at that time, allowing postmasters to provide them, if de-

sired or collect postage in money. The stamp narrowly missed being burned up with a lot of worthless papers which a widow had sorted out from the belongings of her husband. The name of a friend, still living, was mentioned in the letter. It was shown to him and he suggested that the stamp "might be worth a few dollars" to some collector.

HANDS ARE PULLED FROM DANGER IN PUNCH PRESS

Punch-press operators are furnished a protective apparatus in the form of an attachment that automatically pulls the hands away from the danger zone, should the person forget to do so himself. Cords attached to wristlets the operator wears are so connected to the ram of the press that when it descends, the hands are pulled back where they are out of danger. The "harness" is easily unfastened by means of snap hooks and a comfortable swiveling seat for the press operator is fixed to the supporting column of the safety apparatus.

Punch-Press Operator's Hands, Tied to Safety Guide, Are Pulled Back if He Does Not Move Them

CRYSTAL GAZING GIVES CLUE TO YOUR CHARACTER

Crystal gazing, one of the tricks of the fortune teller, has been adapted by science to study character. The tests, made under the direction of Dr. John J. B. Morgan, of Northwestern university, are

Student Taking Sociability Test with Dr. Morgan at the Audiometer; Gazing into Crystal Encourages a Reflective Mood; Object of the Experiment Is to Determine How Much Sound Is Necessary to Rouse the Subject from Reverie; if a Faint Noise Is Sufficient, It Indicates the Person Is of a Social Type; if Not Easily Disturbed, of Anti-Social Tendencies

designed to show the degree of the subject's sociability. The crystal is placed in a dark room and the subject is seated in a chair before it and told to relax, think of nothing in particular, make no effort to hear anything and just daydream while gazing at the soothing green light that comes from the ball. Earphones are put on and there is a push button in the subject's hand. Close by, in an adjacent room, the professor is standing by an audiometer, used in measuring hearing. After ten or fifteen minutes he releases the tone of middle "C" into the earphone. The ears already have been tested with the audiometer so the professor knows how keenly the subject hears under normal conditions. The tone's intensity is gradually increased. As soon as the subject hears it, he presses the push button. This lights a little red lamp, informing the professor that the sound has broken through the subject's reverie. He now

has an accurate measure of the intensity of sound required to end the daydreaming and that mark the examiner regards as the index of your sociability. If roused by a faint sound, even fainter than heard when alert, the subject is considered of the social type. If an intense sound is needed, he is rated as a person of anti-social type. The reason this test is considered a good measure of personality, Dr. Morgan explains, is that the subject does not know what is being tested and his response is beyond his control, so that it may be regarded as a basically true index. Persons of the suggestible type readily adopt the mood of reverie, do not worry about anything in particular while taking the test, and so are not on their guard. When the sound comes, they are thus likely to hear it even when it is faint. On the other hand, subjects of the so-called negativistic type become suspicious of the experiment, their attention is divided among a number of things they fear may happen and so they miss the sound.

MAGIC MINERAL CHANGES LIGHT INTO ELECTRICITY

1920
 Sunlight is being transformed into electricity at the United States bureau of standards. Without any intermediate medium for generating electric current, a mineral exposed to the sun produces a small but perceptible amount of electricity. The discovery of a means for changing light directly into electric current—though only achieved on a miniature scale—foreshadows the possibility of tapping the sun as a source of power for turning the wheels of industry, operating trains and street cars, and lighting our homes. "We have found a substance that apparently transforms light into electricity," is the authorized statement of Dr. William W. Coblentz, of the bureau.

© Harris and Ewing
 Pill Boxes of Molybdenite, Which, When Exposed to the Sun's Rays, Converts the Light Waves into an Electrical Current

"The importance of this cannot be foretold, but if we can obtain electricity directly from sunlight—and enough of it—there is little need of digging coal."

The magic mineral, known as molybdenite, is sensitized only in spots, these being about the size of a pin point. Thus, for experimental purposes, a sample to be exposed to the sunlight for generating electricity is contained in a discarded pill box. A pinhole is made in this box. The specimen is soldered between two small wires. The box and its contents, upon being exposed to ordinary daylight, produce enough electricity to force the needle of an electrical measuring instrument off the scale. The forbidding term actino-electric is descriptively applied to

the strange behavior of a substance in generating electric current when exposed to the light of the sun or of the moon or stars. The bureau is reasonably certain that the resultant prod-

uct is electricity because it has polarity. The bureau is now attempting to discover artificial means of sensitizing molybdenite or finding duplicate minerals that possess the magical properties possessed by it, molybdenite being very scarce.

ROAR OF NIAGARA MEASURED WITH SOUND TESTER

1783
 Tests with an audiometer have shown that the noisiest places at Niagara falls are at the foot of the American fall, at Prospect point and directly in front of the Cave of the Winds, below Goat island. Seventy units, classified as deafening noise, were recorded here. New York's most clamorous intersection, 6th avenue at 34th street, registered fifty-five units.

WINDOW SASH THAT SWINGS IN SIMPLIFIES WASHING

Permitting washing the outside from the interior of the house, a window sash that can be tipped to a horizontal position may also be lowered or raised in the usual way. It can be adjusted for effective ventilation, and a brass weatherstrip com-

bined with it prevents binding and rattling. The sash is adaptable to either new or old windows.

The Tricks of Camping Out

How to Guard Your Health

By JOHN EDWIN HOAG

Suite 205, Union League Bldg., Los Angeles, Calif

CAMPING trips, whether a cross-country motor tour, to fish, to hunt, or merely to seek relaxation, are invariably for the purpose of retaining or improving that most precious of human assets—health. But, all too frequently the inexperienced camper falls an easy victim to outdoor ailments and physical torments.

Many a camper has been made ill, suffered untold agony, had his vacation ruined, and perhaps been sent home to recuperate, all because of ignorance of a few simple rules for keeping well. The carefree life of the camper, with plenty of pure air, wholesome food, and abundance of physical exercise, is naturally conducive to the building of robust health. The camper who gets sick is thus usually a victim of things almost wholly preventable.

Of campers' ailments, typhoid, dysentery and other forms of intestinal infections, have wrecked more trips than all other forms of illness combined. These are contracted by drinking contaminated water, eating uncooked foods, or from cooked foods to which the germs have been carried after cooking—usually by flies. One of the greatest dangers is bad drinking water. Any camper can easily eliminate this menace by boiling all water of uncertain purity. The best guarantee against typhoid, however, is to call on your physician and get inoculated against the disease before starting on a trip.

Next to intestinal ailments, common colds have sent far too many campers home. The same general rules by which people avoid taking cold at home apply to the camper. For instance, a city man

would never think of sitting down on a sprinkled pavement or in a wet gutter. Yet, I have seen many inexperienced campers sit down on damp ground, or on a log with bark that was soaking wet. There is no surer way of taking cold. If you can't find something dry to sit upon, don't sit! Squat like the Indian does, or sit on your hat.

Wool is by far the best material for camp clothing. It is insurance against colds, sore throat and all the other aches and pains that result from exposure. All good bathing suits are made of wool because there's warmth in it even when wet. If you fall in a stream, or get drenched some other way, remove all clothing immediately, and wring it as dry as possible. No matter how cold the weather, you'll be warmer, and feel better when you've wrung your clothes out. Of course, a change to dry clothing should be made as soon as possible. If such a change is not available, build a roaring fire and get dried out. Never let yourself be caught out on any kind of a camping trip without having a few matches in a waterproof container. Wet boots or shoes should be dried very slowly by hanging them upside down on sticks driven in the ground before the fire. If the job can be done in camp, fill wet boots or shoes with hot sand, gravel or small pebbles. They'll be bone-dry in a few hours.

One of the best investments toward healthful camping is a good tent. It should have a canvas floor sewed into it to make it reptile and insect-proof. There are only a few places in the United States where mosquitoes may be carriers of ma-

An Ideal Outdoor Costume, Made of Wool Throughout, No Skirts to Catch in Brush and Knee-Length Hobnailed Boots

laria and yellow fever. Nevertheless, the harmless variety, found almost throughout the entire country, is a pest to cause serious discomfort to the camper who has no means of protecting himself. The mosquito-proof tent, of course, takes care of the mosquito insofar as sleeping in camp is concerned. And, in this age when most campers cook their meals on portable gasoline stoves, the tent may be used as a refuge from mosquitoes at meal time. The camper who dispenses with a tent, should provide himself with a mosquito net. It can be rolled up in one's bedding or sleeping bag. It is scant excess baggage if not needed. If it is needed, it is worth many times its weight in gold. There are, of course, times when campers come in contact with mosquitoes under circumstances when there is nothing to be done but "face the music." In such instances the only defense is lotions or smudge fires. There are many excellent lotions on the market that will keep mosquitoes away. Lacking any of these, an excellent substitute is ordinary kero-

sene. Wipe it over the face and hands, and hang a handkerchief out of the back of your hat to keep the pest off your neck. Smudge fires are a last resort when no other protection is available, but often useful for making camp even where a mosquito-proof tent is part of the outfit. At least four fires should be built at the corners of the smallest area that will suffice for a camp ground.

If one has been severely bitten by mosquitoes, or by spiders, or any kind of insect, there is no better treatment than applications of spirits of ammonia. It allays the itching almost instantly, and reduces the swelling. Iodine, which every camper should carry, is a good substitute for spirits of ammonia for the treatment of insect bites. An emergency treatment that is always available is to smear the bites with soft mud. It will be found wonderfully soothing. The same treatment also applies to the stings of bees and wasps. Buck ticks, and wood ticks, cause considerable annoyance in some parts of the country. If they cannot be pulled out, they must be dug out as a splinter is removed. A tick bite, or the wound that is left after removing a tick, should be touched with iodine to guard against infection.

The risk that the camper runs of being bitten by poisonous reptiles is by no means as great as is popularly believed. Yet, government records show 740 cases of persons bitten by poisonous reptiles last year. Of this number seventy-eight died. It is therefore advisable for all campers to be prepared for such an emergency—or better still, to know how to avoid poisonous reptiles as nearly as possible.

The precaution of the snake-proof tent has already been mentioned. A wise camper does not select swampy ground, or an area against ledges of rocks or cliffs, for his camp site. Such locations are snake territory. They are not the best camp sites anyway. No camper has any business running around barefooted. High boots, or stout shoes with leggings, are by far the best footwear for camping; and obviously, snakes haven't much chance at a person so clad. But campers do get bitten by poisonous snakes occasionally in spite of these precautions. It is, therefore, advisable for every camper

An Ideal Camp Site, with No Rocks to Give Reptiles a Hiding Place, No Boulders to Work Loose and Roll Down on the Camp, and Good Drainage in Event Rain Should Come

to provide himself with an anti-venom kit. Such kits are sold by all sporting-goods houses. A good one should consist of a small scalpel, a ligature, hypodermic syringe, and vials of distilled water, potassium permanganate and strychnine. Instructions for use always come with the kits. In cases of snake bite with no anti-venom kit available, the best emergency treatment is as follows: If one is bitten, for instance, on the hand, the ligature, a stout string, a wire, or anything that will stop the flow of blood should be tied tightly around the wrist. The bite should then be gashed with a sharp knife, safety-razor blade or any other instrument, to make it bleed freely. After bleeding thoroughly, the ligature should be loosened slightly every twenty minutes to avoid the possibility of gangrenous mortification. This treatment, while crude, has saved the lives of many persons bitten by the most deadly of all North American reptiles, the diamond-backed rattlesnake.

Cauterization of a snake bite by fire is a painful but effective treatment. The ligature should be used, and the wound bled, after which it is seared with a hot iron, hot knife blade or stone. One case is recorded in California of a prospector who performed this operation with smokeless powder. He opened a shotgun cartridge, heaped the powder over the wound, and calmly touched a match to it. In the hospital, where he arrived forty-eight hours later, he was treated only for the powder burn. The surgeons declared he

could have chosen no more effective method for completely destroying the poison.

Having covered most of the major menaces to human health while camping, we now come to several which are not dangerous, but very annoying—such things as hay fever and skin eruptions caused by poison ivy and poison oak. The hay-fever victim has but one recourse. That is to consult a physician for a hypodermic “shot” of pollen serum. For many persons this treatment offers complete immunity. Many people are immune from plant poisons, such as poison ivy and poison oak. Those who are not immune should learn to identify these plants on sight, and then use care to keep clear of them. A serious attack of poison ivy or poison oak is a case for a physician. If no physician is available, temporary relief, and in some cases complete cures, are effected by frequent applications of strong solutions of sugar of lead (a deadly poison if taken internally), baking soda or ordinary photographers’ hypo.

The foregoing topics cover the methods of avoiding most of the physical difficulties that are familiar disrupters of otherwise successful camping trips. It is impossible to cover them all in detail in this article. A few additional trouble makers may be summed up in the following

“DON’TS”:

Don’t kidnap a bear cub unless you’re willing to go the limit with its irate mother;

Take chances with fire in the forests. See that your campfire is out before you leave. Better yet, use a gasoline camp stove;

Go fooling around bad water with hip boots on. It's O.K. if you're contemplating suicide;

Look at the water while crossing a stream on a log. Keep your eyes on the log. Test the bark before you step on it if the log is not newly felled;

Ford a swift stream if the water is more than knee-deep, without knowing what the water is like immediately downstream;

Camp under lone trees in thunderstorm country. Such trees are targets for lightning;

Camp under trees that show dead wood. A heavy piece may come down;

Camp at the foot of cliffs, or under steep slopes where you may be bombarded by falling boulders, landslides or avalanches of snow;

Camp in the west in the bed of a dry wash. A cloudburst may almost instantly turn

Above, a Thirsty Motorist Taking Chances with Typhoid, Dysentery and Other Diseases; Center, Treating a Rattlesnake Bite by Tying a Ligature above the Bite, Bleeding the Wound Freely and Then Injecting Potassium Permanganate from the Anti-Venom Kit; a Good Tent, with Sewed Bottom, Is Insect, Reptile and Weather-Proof

the dry wash into a roaring river;

Make camp on low ground on the bank of a stream. The stream may rise;

Be a dirty camper. Scraps of food thrown about may be out of your sight, but flies and ants will find them. Burn or bury your garbage and bury the tin cans;

Go into woodlands or swamps without a good compass;

Swing an ax without being sure it isn't going to catch in twigs or branches overhead or behind. It will cut human flesh as well as it does firewood;

Crawl into caves. You may get acquainted with a skunk, or something worse;

Try to live out of tin cans while camping. Take time to prepare good meals;

Try to subsist upon greasy, fried food exclusively. It's a sure way to get sick. Vary the diet with boiled and baked stuff;

Take chances with rickety, or overloaded boats. If you use a derelict, test it thoroughly before you venture away from the shore;

Camp under mesquite trees in the west-

ern deserts. They are the roosting places of hawks, owls, and vultures;

Try to get along without a bath just because you're camping. Take a sponge bath, with a pint of water if water is scarce;

Go camping without a small medical kit of simple home remedies, such as salve for burns and sunburn, cathartics, dental floss, iodine and bandages;

Try to sleep on a canvas cot in a chilly climate. The canvas cot is a dandy warm-weather bed, but it gives cold comfort in a cool country, or in high altitudes;

Go into high altitudes and indulge in violent exercise before you become accustomed to the elevation. You may permanently impair your heart action;

Try to swim in high mountain lakes unless you are used to such altitudes. These lakes are cold and "crampy" and the altitude makes people short-winded under the exertion of swimming;

Go scaling around in mountainous country until you've learned something about mountaineering. The rankest amateur can climb up a cliff, where he'd have to have eyes in his toes to get down;

Leave loaded firearms strewn about the camp. Have a place for them that will eliminate possibility of accident;

Try to wade a trout stream with rubber-soled footwear. You'll skid like an automobile on a wet pavement.

Here are a few "do's":

Scoop out a trench in the ground, and make your bed in it, if you sleep cold. If you haven't a sleeping bag, put a poncho, or some other piece of moisture-

proof material, between the earth and your bed.

If weather conditions look unfavorable, prepare for the storm before it begins. It is easier to dig a trench around your tent before the rain starts. It is also far better than being floated out of bed.

Always take more than one pair of boots or shoes on any camping trip. If you get wet feet, you'll be glad to have the extra pair. Changing shoes occasionally will also avoid sore feet.

Always cover yourself up with one more heavy blanket when sleeping in camp than you are in the habit of using at home, even if your home and camp-site temperatures are approximately the same. Add an extra army blanket for each 2,000 feet of higher elevation, or degree of more northerly latitude. Add one army blanket for seashore as compared with inland sites.

Three shots fired in succession, followed by a pause, and then two shots in succession, are recognized, or should be recognized, as a distress signal among all outdoor people.

Rub hot vinegar onto a sprained ankle, or on any part of the body where an ache or pain starts. This age-old remedy is known as "camper's liniment."

The camper who follows these few simple instructions will find the health and accident risks of camping far below those of civilization, and he will not only gain in health, but enjoy added recreation and comfort on any camping trip.

FLYING DARK ROOMS TURN OUT PICTURES IN THE AIR

Preparing to Toss a Cylinder Overboard and, Left, Removing Developed Negatives from Basket Dropped from Plane; One Side of the Negative Is White So Picture Can Be Seen without Printing

Torpedo Filled with Flashlight Powder Attached to Plane and Picture of City Taken from Building Roof by Light of Flash Exploded from Speeding Airplane

Night flashlight pictures developed in the air, flying dark rooms and cameras that shoot pictures 200 miles away, are the recent developments in the art of aerial photography. It is now possible to take a photograph of a region while speed-

ing above it and eight minutes later have a finished picture which the cameraman and his pilot can look at, or drop down to the staff headquarters on the ground, in case of military operations. This is accomplished through the development of a

Air Service, Engineering Division, McCook Field Dayton, Ohio
1801
Eastman Kodak Co.

special film and flying dark room installed in the front of the observer's seat. With his arms thrust through sleeves in a light-proof apron over the boxlike dark room, the cameraman swiftly immerses his exposed film in a thermos tank containing developer. After the proper interval, it is taken out and plunged in the fixing bath, and then into the bleaching and quick-drying solutions. Final drying is accomplished in a stream of air from the exhaust. The finished film is then pushed into a message basket, and when the airplane swoops near the ground, the basket is tossed out. When opened, the basket is found to contain a film, similar to negatives which the amateur photographer gets back along with his pictures when he has a roll film developed, with the exception that one side of the negative has a whitish appearance which makes it possible to see the picture on it without making a print. Everyone knows that, by holding an ordinary kodak negative up to the light, it is possible to get a general idea about the picture, but in order to get the detail, it is necessary to make a print on white paper. With this new film, a special process makes one side of the negative white and gives a pretty fair positive of the picture without printing. For reproduction purposes, prints can also be made from it just the same as from any other negative. Flashlight photography also is being developed. By dropping huge flashlight torpedoes from a plane it has been found that conditions similar to that of a clear sky at four o'clock on the shortest day of the year were obtained by the artificial light. Further developments in the art of aerial flashlight photography are expected to perfect a flash that will be so instantaneous in its operation that the eye will not register it. The third wonder in the catalog of the aerial photographer is a master camera for use in shooting pictures 200 miles away. A special lens and ray filters cut out the haze and make it possible to photograph objects beyond the range of the human eye. This camera must necessarily be used six or seven miles up, where frigid temperatures are encountered. To meet these adverse conditions the camera is equipped with heating devices that will keep the film emulsion in proper condition and prevent the hardening of the oil that lubricates the shutter and other movable parts.

Taking Exercise with Focusing Machine Which Develops Small Muscles of the Eyes

EXERCISER FOR EYE MUSCLES TO AID VISION

One of the latest instruments that scientists have devised to aid the eyes is an exerciser for the muscles used in achieving the proper focus. It consists, in part, of a series of prisms so arranged that when a person looks through them, rapid changes of focus are induced, thereby giving the muscles helpful exercise and strengthening them with reserve force. The apparatus is said to have proved beneficial in the treatment of eye disorders caused by weak muscles.

FLYWEIGHT AUTO FOR RACES TO TRY FOR RECORDS

Speed of 175 miles an hour is anticipated from a small racing automobile which has been built for British contests. It is in the "flyweight" class, weighing only 1,500 pounds and has been designed especially for races on the sands at Southport, England.

A Marvel of Beauty and Speed, a Giant Ocean Liner as It Looks While the Tailors of Steel Are Fitting the Steel Plates and Ribs into Place to Form the Perfect Hull

How Great Liners Are Tailor-Made

THERE is, apparently, little in common between the construction of an ocean liner and the making of a suit of clothes or a woman's dress. Few realize that patterns are as essential to the shipbuilder as to the tailor or dressmaker, and that all the parts of the hull of a steel vessel are first prepared, in full dimensions, in paper or wood.

Yet, just as it is necessary for the tailor or dressmaker to work with patterns if the parts of the garment are to form a whole that will present an attractive appearance and withstand wear and tear, so it is necessary for the shipbuilder to have a full-size pattern for every plate and shape that goes into the ship in order that the parts may fit together and form the vessel as conceived by the designer.

The construction of the liner "Malolo," designed by William Francis Gibbs, who reconditioned the "Leviathan" and was largely responsible for the design of the standardized troop ships built during the world war, offers a tangible illustration of the necessity of these patterns and the manner in which they are prepared.

The vessel is now being built at Cramp's shipyard, Philadelphia, for the San Fran-

cisco-Honolulu run, and when completed, will be the largest and fastest high-powered passenger steamship ever built in the United States. Since the construction of the ship involves a number of unusual features, it is essential that great care be taken in the design of each and every plate and shape.

The patterns for the "Malolo" are prepared in what is known as the mold loft of the shipyard. This is an immense, well-lighted room with a wooden floor that is really a huge blackboard. The loftsmen, armed with pieces of chalk, wander over this blackboard, transferring to its surface the drawings of the ship prepared by the draftsmen. This time, however, the drawings are full-size.

Once the lines have been drawn upon the floor, the curves are taken by long, flexible wooden battens which are bent to the chalk outline to provide a wooden pattern, or template, for fashioning one of the ribs, beams, stern plates or other part of the vessel.

Each pattern receives an identification mark to indicate its position in the hull, and is then sent to the shop where it is copied in metal.

Above Is the S. S. "Malolo," the Largest and Fastest Passenger Vessel Ever Built in the United States, and Below, the Wooden Pattern for the Boss Framing of the Propeller Shaft

Here Are the Workmen Making the Wooden Pattern for the Main Deck of the "Malolo"; Every Part of a Ship Is First Laid Out on the Floor of the Pattern Loft

Side View of Seats, Showing Springs, and Arrangement inside Auto

HAMMOCK SEATS FOR AUTOS ADD SAFETY AND COMFORT

1631 Automobile seats invented and patented in Germany permit the occupant to rest practically suspended on springs, which minimize all shocks and jars and reduce the likelihood of falling out in case of accident. They are shaped somewhat like rocking-chairs, the frame consisting of sheet metal bent to a curve and extending from the knees to the neck. A cloth strip is stretched over this frame and several spiral springs are arranged under the cushion below the knees. The seat necessitates no fixed position so that the body can be shifted easily and quickly, and is mounted on a kind of metal sled which may be attached to the floor of any car after the usual seats have been removed. The units can be placed two or three abreast or used as emergency seats in cars for six or more passengers.

DOGS POSSESS PSYCHIC POWERS 1838 ACCORDING TO OWNERS

Why is it that a dog instinctively seems to understand the mood of its master? Why can they sometimes pick out the trail of their master's automobile and follow it? Because they possess psychic powers, in fact, are the most psychic creatures there are, according to Albert Payson Terhune, the writer, who has devoted several years to the raising of thoroughbred dogs. He gives specific instances in support of his opinion. On one occasion, while in New York, he suddenly decided to visit his kennels at Sunnybank, N. J. A few minutes later, his superintendent called him by telephone. "You're coming home today, aren't you?" the manager said. "Yes, but how did you know it?" Terhune replied. The superintendent explained that, five minutes before, "Wolff," one of the dogs, had come racing up to the house from the kennels, barking and leaping in a joyful manner. Mr. Terhune declares that this cannot be considered a mere coincidence as it has happened three times. Another dog that he had taken to a kennel at the home of a friend escaped and attempted to find its master by following the road they had taken by automobile in reaching the kennel. The way led to the Hudson river where Mr. Terhune's car had crossed over by ferry. Since the dog could not see to the other side, it apparently had managed to pick up the trail of the automobile, made twenty-four hours before.

BOOKMARK KEEPS THE PLACE 1496 AS PAGES ARE TURNED

Being clamped to the binding, an automatic bookmark, introduced in Germany, falls into position as the pages are turned, so that, if the volume is suddenly closed at any time, the place is held without the need of special adjustment. The marker consists of a thin strip of spring steel on which is a small tab that slips past each page and holds those that have been turned from blowing or falling back.

VETERAN COAST GUARD CUTTER

1953 TO BE REPLACED BY NEW

The coast-guard cutter "Bear," veteran of forty years' service in the Arctic, and one of the most famous wooden vessels afloat, is at last to be retired in favor of a modern steel ship, with the latest developments in oil engines

Commander J. F. Hottel with Model of the New Coast Guard Cutter "Bear," Now Being Built to Replace the Veteran Vessel

and electric drive. The successor, now building, is to receive the same name, in order to keep the "Bear" traditions alive. Built in England as a whaler, the old ship was well designed for bucking ice. Having been bought by the American government back in the seventies, to join the rescue fleet sent to the aid of the Greeley expedition, the "Bear" was soon transferred to the coast guard, and for forty years has made an annual trip from San Francisco into the Arctic and back again. In its long career it fought the seal poachers of the Pribilof islands, rescued the crews of scores of whalers which went down in the ice, and administered justice over a vast domain. The new "Bear," built of steel, is specially designed as an ice crusher. It will have an overall length of 216 feet. The steel shell will range from one to one and a quarter inches in thickness, so designed that it can bend and give before the ice and then spring back to place. Instead of the ancient 350-horsepower steam engine of the old "Bear" (which could lift its propeller clear of the water and

make ten knots under sail when winds were favorable), the new ship is to have two main engines of 600 horsepower, and three auxiliaries, two of ninety and one of twenty-four horsepower.

PLAN BARRIER-REEF SURVEY

1758 FROM FLYING BOATS

Six flying boats have been constructed in England for the proposed survey of the great barrier reef off the northeast coast of Australia. This huge formation has been built up from tiny coral polyps until it now covers nearly 100,000 square miles, is 1,200 miles long and from ten to thirty miles from the coast. It acts as a huge breakwater and is most dangerous to shipping, although the channel between the land and the reef is safe, as are many of the smaller openings which give access to the coast. During the survey, some 200,000 pictures will be taken.

FRUIT-PEST KILLER APPLIED

1536 BY MOTOR SPRAYER

Spraying vines, trees and vegetables with different kinds of dust deadly to insect pests, has proved an effective way to improve crops, and to expedite the work and secure even distribution of the material, a motor-driven spreader has been devised. It consists chiefly of a small

Dusting Two Rows at Once with the Motor Powder Spreader; Nozzles Reach Upper and Lower Parts of Plants

gasoline engine which drives an air current through nozzles aimed to direct the dust upon the growths to be treated. The material is supplied to the spreaders from a large hopper. The outfit can be driven between the rows of vineyards, orchards and other cultivations and reaches both sides of the row at one time. Special forms of the apparatus are devised for different kinds of crops, and attachments are also made for driving the blower directly from the engine of a tractor, eliminating the need of a separate engine.

HORDES OF LONG-TAILED RATS DEFY SUBMARINE CREW 1482

Men aboard one of the largest of the United States submarines, schooled to battle dreadnaughts, found that they had a defiant and dangerous enemy close at hand when they returned from a South American cruise. The foes were huge, long-tailed rats. They proved too clever for traps and, multiplying in large numbers threatened to take possession of storerooms and other parts of the craft. Poison was out of the question because the animals would have secreted themselves in remote corners of the craft to die. Clubbing parties were finally organized. Members of the crew made daily sallies against the rodents, but at last reports had not entirely conquered them.

N.Y. Herald Tribune

SILENT BRAKEMAN ON ENGINE AIDS RAILWAY SAFETY 1777

Brakes are applied on the entire train the instant the engine leaves the rails, by a safety device invented by a fireman. It operates even if the pony truck drops from the rails. This is important, as the pony truck of a large engine may become derailed and the crew will not know it until frogs, switches or some solid object is struck, causing the entire engine to leave the track. The attachment is connected to the air-brake control in the locomotive. It is said to have worked without failing in numerous experimental tests, and has been installed on some of the heavier types of engines used on hauls across the Blue Ridge mountains.

Safety Device Applies Brakes Automatically if Front Truck Leaves Rails

Learning How to Write with Aid of Metal Guide Attached to Edge of Tablet

arm and finger movements in forming the letters by means of indented aluminum guide strips attached to a writing tablet. They are printed with the alphabet, half on one side and half on the other, the characters being depressed so that they can be followed with the pencil for practice before attempting to produce the letter on paper. Three strips, one with capitals, the other with small letters and a third with the numerals, are included in one of the guide outfits with a convenient carrying case and a tablet.

TRICKS TRIED BY IMMIGRANTS TO ENTER UNITED STATES

185 Immigration inspectors are meeting some interesting and amusing situations as a result of the establishment of definite limits to the number of aliens who may enter this country yearly. Believing that negroes had a better chance to become citizens than other races, a large man from Bulgaria blackened his face with coal dust and attempted to "crash the gates." He had neglected to color his hands and neck, however, and was caught. Sent back, he marveled at the cleverness of the guards. Another declared that he was a veteran of the United States army. His proficiency in English gained him attention. "What war were you in?" the inspector asked. "I was with Washington at Valley Forge," the applicant replied, stating

further that he was well acquainted with the "father of his country" and knew how to drive an automobile well. A young man insisted that he should be admitted as he said he belonged to a privileged class and claimed a college professorship. Inquiry developed that he had been conducting a barber college.

TWENTY MILLION MOTOR CARS 1664 REGISTERED IN U. S.

There is now one motor for every 5.8 persons in the United States, according to figures for 1925 from the bureau of public roads of the department of agriculture. Total registrations reported for the year were 19,954,347, which did not include 96,929 state and federal-owned motor vehicles. The increase in registrations during the year was 2,360,670 or 13.4 per cent. Florida reported a gain of 46.8 per cent, while Utah, Mississippi, Alabama, Arkansas, North Dakota and Texas each had increases of more than 20 per cent. New York has more automobiles than any other state, the total there being 1,625,583 in 1925. California, Ohio, Pennsylvania and Illinois follow in the order named. The total revenue from registration fees, permits, and the like, amounted to \$260,619,621, of which \$177,706,587 was made available for state highways.

LID OPENER FOR EGG CRATES 1519 PREVENTS SPLITTING

Tops of egg crates are said to be removed without splitting and at a great saving in time with an opener now on the market. It is simply a thin piece of steel with a handle at one end. The bar is slipped under the lid, pressure exerted and the top comes off as a whole. The usual method generally causes a loss of three or four cents on each egg crate, or from \$12 to \$15 a car. One man can open 500 cases a day with the new implement, the makers assert.

Catching the Art Faker

Projecting Four Kinds of Light, Including Ultraviolet, This Apparatus Enables Paris Police to Detect Erasures and Faked Signatures on Paintings

A SHORT time ago a French art dealer, who had spent most of a lifetime supplying works of art to museums and the homes of the rich, announced that a leading American museum housed at least \$600,000 worth of art fakes. Furthermore, he added, the Louvre national gallery of France, had been buying faked old masters for the past twenty years. And to prove the truth of his charges he declared that he knew they were fakes because he sold them to the two museums!

That famous museums and noted art critics have been misled by spurious art works since time immemorial is well known, but the engaging frankness of Jean Vigouroux in admitting that he

had supplied the forgeries to two big museums cast renewed light on the extent of the art-forgery business, and the methods undertaken to defeat it. The business, which centers in Paris and Italy, was interrupted during the war, but has since been revived on a bigger scale than ever. Anything that has value is faked, be it a painting, statue, stained glass, gold, silver, furniture, or what not.

To detect the fake is one of the hardest of tasks, but science is able to give some aid. The spectroscope shows the composition of the pigments in paint. If the materials used do not check with the formulas known to have been in use at the time the painter lived, then science is

Restoration Job on an Ancient Altar Piece; This Is Legitimate Work, but Restoration Sometimes Is a Disguise for Fraud

An Imitation of the Dutch School by an Italian Artist, Who Does His Work So Well He Could Fool Experts if He Desired

able to say at once that something is wrong. But the presence of modern paint does not always mean a fake, since practically every genuine old master has required considerable retouching to make it presentable. The real task is to determine whether there is an underlying basis of genuine old master, which has been subjected to modern restoration, or whether the entire work is modern.

The canvas likewise comes in for study. The material must be of the proper weave and material for the supposed date of use. But here again the wily faker may defeat the expert by buying some worthless daub executed at that period, painting over it an imitation after the manner of some famous master and affixing the latter's name. The expert then finds a canvas of the same period, an underlying layer of paint made from the proper pigments, and over it a painting which may be merely restoration, or a new job. Brush strokes, varnish, signature, and other details are scrutinized. Chemical and scientific tests

are made to determine whether an artificial aging material has been applied, or whether the effect is the natural patina gathered through the centuries.

A. B. Laurie, one of the first to use science in detecting painted frauds, determined by microscopic examination and photography the characteristic brush strokes and other details of genuine old masters, and compiled a mass of data which could be applied to future investigations. Faber, in Germany, Heilbronn, in Amsterdam, and Dr. Andre Cheron, the well-known French radiographer, used X-rays to trap the fakers. One of Heilbronn's first cases involved a famous picture of the Crucifixion, which had been donated to a leading art gallery. A figure of a kneeling nun was suspected of being modern work. Under the X-ray, the nun disappeared and in its place appeared a praying monk. The nun, it developed, was a portrait of the woman who had given the picture to the gallery.

Dr. Cheron, pursuing his X-ray studies, found how to determine the age of a picture. The old masters gave a much clearer X-ray picture than modern works, because the modern artist sizes his canvas with a paint containing white lead, and lead obstructs

the rays. Modern restoration work shows up as spots in the X-ray photographs, and every bit of repair work is disclosed.

Sometimes even old fakes are discovered. A painting of the Dutch school, showing country folk dancing at a fair and playing music, was attributed to Adrian van Ostade. Under the X-ray all of the figures except one faint head dissolved, and in their places appeared a collection of peacocks and barn-yard poultry. Yet the country-fair picture was very old, for its pigments passed the rays readily.

M. Bayle, director of the identification bureau of the Paris police department, carried the work still farther. Noticing that photographic plates coated with gelatin bromide display varying degrees of sensitivity to different colors, he photographed a suspected picture under a strong light so that the characteristic brush strokes and the touch of the artist were clearly revealed. He built a special machine with four light sources, emitting converging rays. In the paths of three he

This Picture of the Good Samaritan, Valued at \$500,000, Apparently Executed in 1632, Was Picked Up by an Expert for a Song in an Australian Secondhand Store and Brought to America

placed red, blue, and green-colored screens, while the fourth provided pure white light. Rheostats controlling the power to the lights made it possible to darken three and increase the fourth at will, and under the varying lights different characteristics stood out. In the course of the trial of a case involving the authenticity of a picture attributed to Renoir, he was able, with his lights, to throw into relief the peculiar manner in which this artist used his brush, as a result of a stroke of paralysis.

Ultraviolet rays excite the fluorescence of certain mineral colors such as are used for modern fakes, so Bayle built an apparatus using a mercury-vapor lamp in a quartz globe, such as was described in *Popular Mechanics* recently for use in taking pictures in the dark, and by this means was able to expose faked signatures and other painted frauds. In one case, M. Bayle was called by a judge to determine whether the famous Spanish painter Goya actually drew a portrait thought by

experts to be the work of Tirana. He first photographed the disputed picture under the three colored lights, making it stand out in relief from the background, and showed up the retouching which had first excited comment. Under an X-ray examination of the head, he found a varnish containing white lead had been used. The ultraviolet light turned the signature "Goya. A. 1799" fluorescent, and beneath it could be read "Tirana, 1792."

Another French physicist, M. Paul Lambert, has developed an apparatus which enables the investigator to see an old and faded picture as fresh and bright as the day it left the artist's studio. Old paintings, when hung in galleries, often are practically invisible because the time-aged and cracked varnish reflects so much light the observer cannot see beyond it. Lambert employs an intense arc light, fitted with condenser and lens to give parallel light waves. He found that, if the reflected light from the varnish was polarized it became invisible. A prism made of Iceland feldspar, when rotated rapidly, has the property of polarizing such light, so the picture viewed through it appears bright and new in the intense light from the arc.

The advances of science, however, while they may save the individual from buying a faked old master, have not curbed the activity of the fakers. In the studios of Montmartre and the Montparnasse in Paris hundreds of painters are busy turning out the spurious work for the trade. Some work from carefully aged, but modern canvases, and others are painting over worthless but old works. They use science, too, applying the latest methods of fakery to meet the latest discoveries in the way of detection.

Not long ago one faker hired a lonely chateau with only one servant and proceeded to turn out twenty-five copies of genuine Corots, Daubignys and Rousseaus. With the background of the chateau, he had an ideal setting from which

to offer to sell his "family heirlooms" to unsuspecting buyers. Another faker turned out 100 copies in twelve months, working in secret at the same chateau.

The business of detecting fakes is enormously magnified by the fact that many of them were not originally intended to mislead. The fakers buy up the output of pupils of the old masters, not valuable in themselves, and by a bit of clever retouching and a forged signature, sell the works as genuine. Their task is made easy by the fact that the pupils invariably caught and used much of the technique of the teacher.

In Italy there is a legitimate and active trade in what is called "pasticcio," accurate and carefully aged copies of old masters. As painted, they give the poor man a chance to obtain, at small cost, a real copy, properly aged, of some famous painting, and when sold at a reasonable price as copies, the business is quite proper. But in the hands of the faker pasticcio quickly acquires a forged signature and an enormous price tag.

Faking of art works goes back at least as far as the early days of Rome, and perhaps much farther. When Rome grew

wealthy and began rifling the world for art works, the fakers got busy. It is recorded by one Roman historian that the emperor himself had a vast gallery full of fakes. Growing pressed for money he announced an auction, but, like the faker today, carefully concocted signatures and pedigrees for all his fakes. Suspecting that the shrewd citizens might still hang back, he invited a wealthy, but notoriously sleepy man, as special guest at the auction. Every time bidding lagged the auctioneer would look over, see the sleepy millionaire's head nodding, and knock down the sale to him. When the millionaire woke up he found he had bought \$400,000 worth of fake art while asleep!

Museums do not as a rule advertise the fact that they have been defrauded. Nevertheless the Louvre is on record as a frequent victim, as is the museum at South Kensington, England, while the number of American millionaires who have built marble palaces to house frauds is by no means small. Giovanni Bastianini, an Italian worker in terra-cotta, perpetrated some famous fakes in his day. He turned a bust of Savonarola in imitation of the work of Mino da Fiesole, which was so

An Artist Whose Work Has Been Imitated, Sometimes with Fraud in View; This Is Velázquez' Famous Painting "The Smithy of Vulcan," Which Hangs in the Prado Gallery in Madrid

Indian blankets and implements made in New England are on sale throughout the west. Picture faking is discouraged in American museums where old masters are on view for artists and students to copy. Most of the art galleries

Above Are Two Modern Forgeries, Made in London, the One a Creamware Bust of Washington and the Other a Peter Bates Loving Cup; in the Center Is the Spectrograph Which Analyzes Paints, and at the Right the Terra-Cotta Bust of Savonarola, Forged by Bastianini and Sold to the Victoria and Albert Museum as Genuine Quattrocento Work

good the Victoria and Albert museum at South Kensington bought it as genuine quattrocento work. Another of his busts, of a friend of Savonarola's, was one of the prize exhibits at the French world's fair in 1867, and was sold to the Louvre for \$3,000. The maker, incidentally, only got \$70 for the work, so even fakers aren't always highly paid.

One of the most amusing stories in the history of experts misled is that of a German professor who spent years traveling through darkest Africa making a wonderful collection of assegais, or native spears. He amassed scores of beautifully carved examples, with polished steel blades and extremely long and bulky handles, and eventually transported his collection to Europe to present it, with a monograph on the tribal carvings on the spear heads, to a German museum. At Rotterdam he unpacked the collection to show to a friend, and the friend discovered something that had been overlooked in the wilds of Africa—all the spears bore the small but distinct trade-mark of a Birmingham cutlery maker!

Faking is by no means confined to Europe. One of the oldest of fakes was invented by the New Mexico Indians who manufacture, bury, and then dig up "antique" pottery to sell to the tourists, while

do not permit a copy to be made in the exact size of the original, and before brush is put to the canvas, it must be stamped, in imperishable ink, to the effect that it is a copy.

The picture faker has held the stage because of the big demand for his wares, but there is really a larger business in faking statues. With modern power-driven carving tools, operated on the pantograph principle, the faker can produce an exact copy of the original, or as many exact copies as he desires. The expert's only hope of detecting the fraud, after the copy has been properly aged, depends on his eye for what he calls the "touch of the master." And it is hard to find two experts who agree on such intangible things as a master's touch.

PLATINUM'S AID TO SCIENCE
INCREASES ITS VALUE 1958

184373

Not so many years ago platinum was only a curiosity to scientists. They didn't know what to do with it. Today, however, it is approximately six times as valuable as gold, the price rising from less than half that of gold in 1880 to \$120 an ounce. During the war, when there was a large demand for it in the making of high explosives, its price went up to \$150 an ounce. The metal's service in chemical and experimental laboratories as well as its employment in jewelry, is one of the reasons for its high market value. It will not melt even when heated to a temperature of 3,000 degrees Fahrenheit, resists almost every kind of acid, does not change in the air and is exceedingly malleable and ductile. Crucibles of it may be heated to incandescence while their contents are bubbling, but the metal itself will not melt. In the jewelry field, it has proved adaptable to working fine designs, because tiny strands of platinum will stand far more strain than gold. Plates of it as substitutes for parts of the human body are being used in surgery and it has been adapted to uses in the electrical industries. Some 300,000 ounces of the metal are required each year. A recent discovery of platinum deposits in Wyoming promises to affect this country, as at present less than a thousandth part of the amount used here annually is produced in the raw state in the United States.

Here's a Sign That Every Hunter Believes, a Bear-Trap Warning Set on an Alaskan Trail

SIGNBOARD NEAR BEAR TRAP
PROTECTS HUNTERS

"Beware! A bear trap has been set near by." This warning is conveyed to the hunter or trapper by a homemade signboard which is often placed along a salmon stream in Alaska so that travelers will not step into the powerful steel jaws designed to hold the paws of a big bear. The average trap is so strong that it would be impossible for a lone hunter to extricate himself should he blindly step upon the trigger while following a trail through the woods. The traps are placed in ways the brown bears use in going to and from their feeding grounds. In the illustration, the big animals were frequenting a salmon stream to catch the fish and the trap was set in a trail leading to it.

Half-Million-Dollar Tower Model of Pearls and Platinum to Be Shown at Philadelphia Exposition

metals, made by Japanese craftsmen, is to be exhibited at the sesquicentennial exposition in Philadelphia and then given to the United States as a symbol of Nippon's friendship for this country. In all, more than eight and one-half pounds of pearls, natural and artificial, were used, and several hundred persons helped in the work which required five months to complete.

PLAN MEMORIAL TO INDIAN GIRL GUIDE OF LEWIS AND CLARK

1837 In a bill recently introduced by Representative Winter of Wyoming, congress has been asked to provide a suitable monument for the grave of Sacajawea, the heroic, but little known Indian woman who guided Lewis and Clark on their expedition to the Pacific. Stolen from her native tribe, the Shoshones, when she was ten years old, she was carried away by a marauding band of savage Blackfeet Indians and later became the wife of Tous-saint Charbonneau, a French trapper in a settlement near Bismarck, the present capital of North Dakota. There Lewis

and Clark discovered her while they were seeking a guide and an interpreter for their undertaking. The explorers endeavored to obtain the services of Charbonneau, but at the last moment, he refused to go with the expedition. Capt. Clark had enlisted the sympathy of Sacajawea, who told her husband that she would kill herself and their child if he did not remain true to his promise. He was finally won over, but Sacajawea herself, with her papoose on her back, led the party through the territory of the Shoshones, down the Snake and Columbia rivers and to the sea, the "Everywhere-Salt Water" as the Indians called it. Aided by her memory of the country which she had traveled as a child, she guided the adventurers through the only feasible pass through the Bitter Root range, and but for her intervention, Lewis and Clark's band doubtless would have been killed by the Shoshones. On one occasion, she went ahead to meet a chief of the tribe whose members were waiting in ambush, believing that the Blackfeet were returning. Seeing him, she burst into tears for it was Cameahwait, her own brother. Again she prevailed upon Charbonneau to remain with the party when he threatened to desert the white men, insisting that he stand by his agreement until they had reached the ocean. She accompanied the travelers on the return trail. They left her at the Mandan villages, and there is no record that she received as much as a token of beads for her loyal services.

MAGNET AUTO-TROUBLE LIGHT SIMPLIFIES REPAIRING

1577 Price. \$2.50

Equipped with an electromagnet of sufficient power to lift seven pounds, a handy trouble light can be placed on almost any metal part of the automobile without danger of falling off. The cord is plugged into any

lamp socket on the car and is eleven feet long for reaching all parts. Less than one-half of an ampere is required to operate the magnet. The lamp is especially useful while taking metal parts out of the engine pan, or as an emergency tail or spotlight, and may also be employed for various tasks about the house.

GIANT THREE-MOTOR PLANE FOR ARCTIC CONQUEST

Cross-Section Drawing of Three-Passenger Plane for Arctic Flight; One of the Most Important Instruments Is the Compass near the Tail; It Is Connected Electrically to Dial in Cockpit

Much of the interest in Lieut. Commander Richard E. Byrd's Arctic venture centers around the huge three-motor airplane provided for the expedition. The plane is forty-nine feet two inches long, stands twelve feet nine inches high, and has a wing spread of sixty-three feet three inches. One of the 200-horsepower motors is installed at the nose and the others on each side about halfway between the

nose and the cockpit. The fuel tanks have a combined capacity sufficient to provide gasoline for a cruising radius of 1,500 miles. At 100 miles an hour, the approximate cruising speed, the plane consumes twenty-eight gallons of gasoline an hour. There are generous storage spaces for food, instruments and guns, and the plane can be slowed down to forty-five miles an hour for landing.

HUGE LAKE FOUND IN CANADA WHERE MAP WAS BLANK

Maps of Canada indicate a large area of land southeast of the Great Slave lake but it has been found that another lake, 150 miles long and several miles wide occupies part of this region. The body of water was recently discovered by G. H. Blanchet, of the interior department of Canada, during a surveying trip on which he explored more than 60,000 square miles of this little known territory. The season's work entailed many hardships, long portages and, because of the difficulties of transportation, the party was forced to rely mainly on fish and game for food. The expedition revealed an excellent series of waterways as a means of entrance to a large expanse of virgin country.

which is believed to contain, among other resources, vast ore deposits, as rich samples of minerals are occasionally brought out by Indians who inhabit districts not yet explored by white men.

CAMPERS' FOLDING COOK STAND ALSO SERVES AS TABLE

Stand Set Up and Being Packed in Carrier

To simplify the task of cooking over a bonfire, a collapsible metal stand for the utensils holds them securely near the blaze where they will receive the heat. When not in use, it can be slipped into a small box for easy carrying. It may also be adapted as a table to hold pots or skillets if an oil camp stove is employed. The stand weighs but three and one-fourth pounds and the cooking space is 200 square inches.

Rex, "King of the Wild Horses," Surveys His Vast Domain from the Heights of Castle Rock, Wyo.; the Big Coal-Black Stallion Has Become Famous as the Hero of a Movie Play

With the Wild-Horse Hunters

By KATHLEEN CAESAR, *24 Herald Tribune*
225 W 40th St New York

WHO will catch "Red Volcano," the capital prize among the wild horses of southern Utah?

For several years the question has been asked among wild-horse hunters and each year brings several volunteers, but no one has succeeded in outwitting the stallion that has been called the cleverest horse on the plains.

All the wiles of the horse hunter have been used against "Red Volcano." He has been hunted by relay riders, but outruns the swiftest horses that can be put on his trail. He has been trapped at water holes, but has leaped the highest corrals. And his trump card, when he finds that he is in danger of being run down, is to dash for a vast volcanic outpouring of lava, near Cedar Breaks. This deposit stretches for miles across the plateau. When the lava cooled, it formed knifelike ridges,

across which the ordinary saddle horse or pack animal can only pick its way slowly and painfully. But "Red Volcano" will dash at top speed across this desert. It would be certain death for mounted men to follow him at such a pace, and the wild horse, after thus shaking off his pursuers, returns to his haunts on the plains stretching toward the Grand canyon.

The case of "Red Volcano" is only one among many instances testifying to the cleverness of the wild horses, which have increased in numbers in the west until they are regarded as a menace to the interests of stockmen and farmers. It is estimated that upward of 1,000,000 wild horses are now roaming the western plains from the Canadian line to the Mexican border. Montana, according to the best statistics available, has 400,000 wild horses within its borders. Nevada and Utah have had

wild horses since pioneer days, and they survive by thousands in spite of being trapped by hunters and shot by sheepmen.

The people in other sections of the country, who cannot realize why wild horses should be a nuisance and why, in this great west of ours, there is not space enough to preserve them as a romantic feature, fail to understand that, for some years now, the west has not been a wild and woolly place, but a settled and industrious section of the country. Stock raising is one of the chief industries and the open range is one of the main sources of food for the live stock. The wild horses in Montana alone eat enough range grass in a year to feed 1,000,000 head of sheep or 500,000 head of cattle, to say nothing of the damage they do running over cultivated ranches. So the war that has been declared on the wild horse is largely economic.

On the other side we have those who justly insist that the wild horse like the buffalo is a part of the picturesque west, and should not be exterminated. The cowboys who hunt wild horses are mostly in the game for the love of the sport. They admire these animals for their sagacity and fleetness and are bitter against the sheepmen who shoot the wild horses at the water holes. The slaughter of wild horses and canning of horse meat, for human consumption abroad, in particular have roused the ire of western cowpunchers. Their attitude was shown in the case of a suspect who was charged with attempting to dynamite a horse-meat canning plant. He pleaded guilty and for justification said, "I couldn't help it. I am a cowboy and I love horses. I can't bear to think of people eating them."

Wild-horse hunting used to be profitable. At the outbreak of the world war, wild horses were sold at from \$30 to \$40 a head. The price has fallen off steadily until now they are hardly worth rounding up. The Indian bureau recently received a bid of from 50 to 75 cents a head for the wild horses on a reservation. Even this was not carried out, as the bidders found that the expense of the roundup precluded any profit.

The Indian reservations are generally overrun with wild horses. How to dispose of these animals is a problem which the bureau at Washington has not yet solved. Frequent complaints are received from leasers and from white settlers on or adjoining the reservations. Recently, while the writer was sitting in the office of the Indian commissioner, an official from a Montana reservation came in to talk over the problem. Under the new law, horses can be disposed of within ten days after notifying the owners.

As horses often travel great distances, settlers complain that this does not give them sufficient time to reclaim their strays that may have joined wild herds. Under the old law, thirty days was allowed for reclaiming animals. Thousands of so-called wild horses in many states are domestic animals that have been abandoned by their owners or coaxed away by wild stallions. Even when these horses are rounded up and returned to their owners, they soon rejoin the wild-horse bands. They may be found again, in a few days, many miles from the home ranches. The problem is particularly acute on and adjoining the Indian reservations in New Mexico and Arizona as well as in the northwest.

Bringing in a Band of Captives; Each Wild Horse Is Hobbled and Tied to a Well-Broken Work Animal, to Prevent a Successful Break for the Freedom of the Open Range

A Pair of Typical Wild-Horse Hunters of Southern Utah, Who Pit Their Skill and Determination against the Craft of the Willy Stallions Which Lead Their Bands into the Mountain Fastnesses

Throwing a Wild Horse Preparatory to Hobbling It, and Below, a Relay Rider Poised, Ready to Take Up the Chase When His Mate's Mount Gives Out in the Race with the Wild Band

The genuine wild horse is a descendant of the first horses brought into this country by Coronado, Escalante and other Spanish explorers in the sixteenth and seventeenth centuries. Lieut. Zebulon M. Pike, in the records of his expedition up the Arkansas river, in 1806, across what is now Oklahoma, Kansas and Colorado, tells of seeing great bands of wild horses all along the trail. The pioneers had trouble with them, as they would come into camp and coax away domestic animals. The early-day hunters were called "mustangers." Roping was their principal method of hunting. Occasionally, when they had chased a good horse without avail, they would resort to "creasing," a tricky method of shooting so that the bullet would strike the animal on top of the neck just in front of the withers and

an inch or two deep, close to the spinal column. This temporarily paralyzed the animal, and the hunter would then tie his front feet and halter him to an ox or a

steady-going farm horse—a method still used in subduing captured animals. Creasing is seldom done, because of the large number of horses killed.

The hunters today resort chiefly to the trapping method. Corrals are built around water holes, and thus the animals are caught when they are forced to come in for a drink. In this way it is not unusual to catch an entire band at one time. The bands seldom run over thirty, whereas in earlier days they counted as high as sixty or seventy.

A Nevada horse hunter recently nearly lost his life in attempting to trap a particularly valuable band. A corral had been built at a water hole. For three or four days the horse hunters lay in wait. At last the band, headed by a beautiful stallion entered the corral. One of the hunters came from hiding and was putting up the bars when the horses rushed in a body at the gate. They crashed through, and the man went down under the brush and heavy bars. Horses will seldom step on anything on the ground if they can jump over it, and to the amazement of the other hunters, they found their companion alive, although the entire band had passed over him in the wild rush.

The real thrill of adventure in wild-horse hunting is running them down in the open. This can only be done by relays of riders. Saddles are discarded and the riding is done bareback, with only a surcingle to furnish a hold. This is done not only to eliminate weight but to save the rider in case of a fall, as it enables him to roll free from the horse. Even with

these precautions, many riders are hurt, for the wild horses are followed at break-neck speed across the rough country. The greatest danger is from badger holes, into which the horses often step and break their legs.

For several years the Indian horse hunters in the vicinity of Ft. Belknap, Mont., have been trying to capture a beautiful stallion which has led away many domestic animals.

"Finally we thought we had the stallion trapped," said one of the horse hunters. "We had driven him into a canyon, across the mouth of which we were prepared to stretch a wire fence. We had no sooner got the fence in position than the horse came dashing down the canyon. We thought that no horse could jump the fence, but the stallion cleared it easily. Then he swam a river and disappeared on the other side. This stallion is constantly on the lookout. He climbs all the high hills and watches for signs of danger. He makes a pretty sight, outlined against the sky, and is worth a good deal of money to anybody who catches him, but no one has turned the trick yet."

The domestic animals which join the wild-horse bands soon become uncannily clever in eluding pursuit. They learn all the hiding places and are as difficult to trap as horses that have never been branded. They may be very gentle and docile in captivity, but when once they have tasted the delights of freedom, all their old instincts return. Similarly, wild horses that have been captured and tamed generally escape to their old life.

Milling Round and Round in the Corral, the Captives Try to Avoid the Cowboys' Lariats by Keeping Continually on the Move, Crowding as Far as Possible Away from Their Captors

FIFTEEN - MILLION RIVER BRIDGE AT NEW ORLEANS

Fulfillment of a dream of more than 100 years is seen as a result of contracts recently signed for the construction of a bridge over the Mississippi at New Orleans. With its approaches, it will be three and one-half miles long, the bridge proper 2,600 feet, one cantilever span, 750 feet, and the structure will rest on piers 112 feet above the water, to permit the passage of large vessels beneath. Difficulties are expected because of the condition of the land. In laying the foundations, forty or fifty feet of water and an undetermined depth of river silt must be penetrated, while some of the ground on which the approaches are to be built is lower than the surface of the river yet will have to be constructed so that railroad trains will not encounter too steep a grade. It is estimated that the bridge will cost \$15,000,000.

MORTISER DRIVEN BY MOTOR ELIMINATES HAMMER

Operated by an electric motor, a mortiser that cuts any kind of wood is said to do the work five times faster than is possible with hammer and chisel. It can be clamped to the unit in which the mortise is to be cut, is mounted on a rolling base for easy moving, and can be raised or lowered as desired. There is a depth gauge which automatically stops the machine when the blade has entered to the desired depth, and slots up to six and one-fourth inches deep can be cut, the necessary adjustments being made quickly.

Colgan Machinery
and Supply Co

Using a Fireman's Smoke Helmet in Place of the Regular Suit, Diver Can Remain under Water Twenty Minutes

SMOKE HELMETS FOR DIVERS REPLACE HEAVY SUITS

Helmets designed especially for fire fighters have been found useful for divers in shallow water, serving as well as the heavy suit for limited depths, according to reports from Portland, Ore. Equipped with them, men remained under water for twenty minutes without feeling any ill effects, the oxygen tanks and valves in the helmets being as impervious to water as to smoke. One advantage of this helmet is that it can be quickly adjusted in case of emergency. It is proposed to have members of city fire departments drill in the use of the helmets as diving apparatus for rescue work.

WAR WAGED ON RABBIT PEST BY BOUNTY AND DRIVES

Roused by the annual crop losses of millions of dollars caused by rabbits, the Colorado legislature has permitted county commissioners to offer a bounty for each one killed. Boys earn pocket money in this way, getting a cent and sometimes more for each pair of ears. But the most successful method for combating the pest is through community drives. As many as 1,000 persons join in, herd the rabbits into V-shaped woven-wire traps and kill them with clubs. Last winter 500,000 were dispatched in this way.

Just Before Elaborate Fireworks Set Was Touched Off; Loops at Right Produce Effect of Flaming Waterfall; Actors in Position for Their Parts in the Spectacular Play

Staging Plays in Fireworks

Unseen "Actors" Take Leads in Blazing Dramas under Skilled Showmen in Sparks

By PAUL PADDOCK

IT had been a scorching day, but the tired crowds at the county fair had stayed late and packed the big grandstand to capacity to see the fireworks display, scenes from the life of Christ. The program promised a bewilderingly beautiful climax. It came unexpectedly with a fizz and a sputter, but was greeted with laughter instead of the gasps of awe and admiration the management had expected. By mistake, the man who was setting the pieces off had touched the wrong fuse. The "Ascension" was fired first!

But such mistakes are rare, according to James Cunliffe, about as infrequent as an injury to the men although they handle thousands of pounds of highly explosive fireworks each week and walk in the thick of it when the big pieces are in action.

Mr. Cunliffe makes a business of supervising the presentation of gigantic spectacles in fireworks. He has spent a large part of his time for the last forty years erecting complicated sets and firing them off. He has literally burned up fortunes and has been paid for doing it. There are probably not more than a hundred experts in this highly technical and exacting form of show production in the United States. They must have a keen sense of the theatrical, skill as carpenters and mechanics,

knowledge of handling all sorts of fireworks and must be resourceful at all times, for winds, rains and the spectators themselves sometimes work havoc with costly displays. But for the prompt action of an attendant recently, there would have been a serious accident at a county fair. An inquisitive farmer, strolling about where a set was being erected, lighted his pipe and tossed the match in the grass. A second later the flames would have reached the fuse of a gigantic fan replica filled with several hundred pounds of powder, shooting stars and rockets. Wind causes no end of trouble, for when it shifts, it may blow the smoke between the pieces and the audience and the sets, shutting off the spectacle. Shellac forms a part protection against rain, but when a soaking shower descends, the men try to be philosophical and get ready to tear down the soggy works for fresh ones. Most large companies carry rain insurance to cover part of the loss in such cases.

Four or five men are often detailed to ignite the fuses of the big pieces. Some of these displays require the burning of as much as \$1,500 worth of fireworks in a single evening. It is now possible to represent the burning of Rome, volcanic disasters, such as the "Last Days of Pompeii,"

Where Drama Is Staged behind "Footlights" That Travel Skyward; Trained Crews Are Required to Fire Pieces That the Climax May Be Reached at the Right Time

regarded as the "Uncle Tom's Cabin" among pyrotechnic displays, battle scenes, and practically any kind of a tableau or design. Colored fire can be manufactured in scores of shades. Bright blue is the rarest, for it is the most expensive. Ways have been developed for regulating the speed at which the fuses burn so that parts of the set are fired in the proper sequence. One of the lances, the technical name for big sets, may contain as much as a mile of fuse. After it is erected, about all that the fireworks man has to consider is the projecting part of the fuse, the "match" as it is called. It is part of his job to find that among the smoke and glare and to touch it off at exactly the right time.

Mr. Cunliffe explained that elaborate measures are now taken to protect the fireworks men. In handling mortars, for instance, heavy barricades are erected so that in case the bomb, which is to be shot high in the air and exploded, should go off prematurely, the force of the detonation would be broken by the obstruction. The lighters carry what are called port fires, a small flame at the

Preparing a Comic Set; an Aerial Bouquet of Colored Flames, and the Use of Fireworks for a Fete in India

end of a special carrier or on a Roman-candle stick, so that their hands and faces are not exposed unnecessarily. Powder used in the exhibition pieces is much more explosive than that in the ordinary firecrackers and candles purchased for your Fourth of July celebration, the com-

mon commercial grade of fireworks, Mr. Cunliffe said. Chemicals are mixed in stronger proportions and fuses are made to burn faster. These factors add to the hazard of the work, while the mere quantity of explosives near which the lighter must walk in semidarkness or thick smoke presents a risk. In some assemblies, there are 150 pounds of powder to every fifty square feet of set.

When a large piece is ordered for display, twenty-five or thirty men will be sent with it to help unload the car, erect the frames on which the "gerbs," the flower-pot blazers and other stationary units, and the "turners," the pinwheels and similar pieces, are to be placed. The design has first been carefully worked out on paper,

Photos Courtesy Thearle-Duffield

A Glowing Neptune in His Chariot Performs before the Curtain of the Night; Sets Like This Contain a Mile or So of Fuse and Many Pounds of Powder

ruled in squares to represent the cross-pieces of the frame and is then transferred to the actual assembly that is to be fired. The lines of the design are traced in flexible rattan. This, like the frame itself, is intended to last as long as the piece is displayed. The units of the work are then attached to this rattan and the fuses of the different parts connected. The fireworks are shipped in bulk, disconnected, and are not joined until actually on the frame, ready for igniting.

Like the human performers, fireworks get a rehearsal but not on the evening before the show actually opens. It is generally done weeks before near the factory, usually on the outskirts of cities where the dangers of explosions will be minimized. A framework is erected, the piece attached according to the directions, which up to this time have been worked out only on paper, and the set is fired while a few critical experts note the general effect, action of the fuses and other details. If the piece passes these exacting gentlemen, it is prepared for general production. Failures on location, that is, when the set is actually to be displayed, are almost unknown, for practically every chance of blunder has been eliminated by careful construction and inspection.

On a big set, prompting the "powder actors" with port fires, the showmen in

sparks, like their theater brethren, are under a director who gives signals, by whistle or other means, when various pieces are to be fired, so that the display will fit in with the rest of the program. In the big spectacles, hundreds of human actors are employed and the effect of their efforts will be largely lost if the fireworks do not go off at the correct moment. Comedy, too, is achieved in this branch of showmanship. From an innocent-looking glow at one side of the set, thunders a tremendous crash as a bomb explodes. A similar glow is seen at the other side of the set and the audience braces itself for another bomb, but a feeble squib sputters and the pyrotechnist has achieved that coveted tribute, a laugh. Comic cartoons and moving comedy pictures are now produced in fireworks.

Keeping the fireworks fresh, dry and always protected from sparks is an important part of the game and may mean the loss or profit of a whole tour. Chemicals in some of the works deteriorate, or the little steel filings in the rockets get rusty and will not glow so brightly.

Fireworks in one form or another are now used in practically every part of the globe. Last season, one company was showing a spectacle simultaneously in twenty-nine cities in this country; a large order was recently received from an or-

ganization in Egypt, and shipments have been made to lonely ocean islands and cities in India. Patriotic ideas are best suited to presentation in fireworks, the showmen have found.

For the sesquicentennial exposition in Philadelphia this year, scenes from the days of 1776 are to be enacted in pageant and fireworks before a curtain 500 feet long and from twenty to fifty feet high. The nightly display will require 300 actors in costume, thirty fireworks operators to manage the ton or so of explosives that will be fired at each performance, three electricians to handle the lighting effects, ten wardrobe attendants and three directors. Sets depicting the Liberty Bell, an action fireworks picture of the battle between the "Bonhomme Richard" and the "Serapis," Betsy Ross and "Uncle Sam's 150th Birthday Cake" are a few of the pyrotechnic tableaux that will accompany the spectacle.

The public is demanding more noise with the fireworks displays, the producers have found. To satisfy the patrons, rockets are now being manufactured that, in bursting, release thousands of glowing whistles which emit shrill notes almost until they reach the ground, a screeching gey-

ser that projects steamlike material fifty or sixty feet in the air, and loop aerals like those of the radio. Realistic imitations of static whistling are produced when the piece is lighted. The trouble gets worse and finally the entire set explodes with a tremendous crash and a shower of sparks.

ORIGIN OF STREAMLINE DESIGN 1446 TRACED TO FISH

Streamline forms, now widely used by designers of submarines, automobiles and aircraft to decrease wind resistance, had their beginning in the natural shape of fish, according to Prof. Edward W. Berry of Johns Hopkins university. He believes further, that flowing water alone did not produce this body shape in fish, for the same results are obtained by a moving fish in stationary water as by moving water flowing over a stationary fish. The form, the professor holds, represents a natural adaptation to conditions. That the shape was developed long before there were fish in running streams is apparent from fossils found in the older strata, which also were of streamline shape.

How a Big Set Looks in Daytime; the Design Is Attached to a Permanent Tracing in Rattan Fixed to Lattice, Squared Like Plotting Paper, on Which Original Pattern Is Made

GRAFTED MUSCLES MOVE GLASS EYES

Movable glass eyes are reported to have been fitted successfully by a specialist of Jena, Germany. He fastens connective animal tissue to the glass and grafts this to the remnants of the subject's optical muscles so that the eye can be controlled in the same way as the natural organ. The doctor has found that in ninety out of a hundred cases involving the loss of an eye, the muscles and nerves controlling the movements of the optic are unimpaired. The grafting operation is delicate but is done in about an hour and is said to have been successful in eighty to ninety per cent of the cases attempted. Much depends upon the condition of the eye socket after the loss of the organ.

Soccer Players at Jumping Practice; the Balls Are Suspended from Bar Which Can Be Adjusted to Different Heights

SOCCKER BALLS HUNG ON BAR GIVE PLAYERS PRACTICE

Soccer players at the university of Pennsylvania practice jumping and head strokes with the aid of a crossbar from which balls are suspended at different heights. Actual playing conditions are nearly duplicated with this arrangement, and the trials are said to be especially valuable in giving the men accurate judgment as well as exercise.

WATER HEATER OUTSIDE BOILER PROTECTED FROM FIRE

Consisting of a copper coil within an iron jacket, a water heater installed in connection with steam or hot-water systems, is placed outside the boiler or firebox so that it is not in the way when coaling, and is protected from damage and scaling by fire. On steam or vapor systems, it is connected below the water line so that the contents will stay hot even after the fires are banked. It is not difficult to install and is always in a convenient position when repairs or alterations are to be made. When used with hot-water outfits, the contents of the copper coil is said to be warmed within fifteen degrees of the temperature of the water which goes to radiators at a minimum of 120 degrees.

Typical Installation of Water Heater Outside of Boiler, and One Side of the Jacket Removed to Show the Copper Coils and Connections

SHETLAND PONIES SELL ALL OVER WORLD

Because of their ability to do a day's work at a comparatively small expense for food, the Shetland pony has found buyers in nearly all parts of the world. They are popular in every circus, for amusing children and, in many sections, as beasts of burden. The smallest specimens are produced in the far north of Scotland, some of them being not much larger than goats. During the fur shortage in Europe, the skins were used for women's wraps.

MOUNTAIN RAZED BY WATER TO MAKE HOMESITES

Using the Gold Seekers' Methods in Building: Washing Down a California Hill to Prepare a Site for Homes; Water Is Pumped from the Sea by Electricity

To prepare an area for homesites, engineers near Los Angeles are pumping sea water through long pipes and leveling a mountain with hydraulic "guns," similar to those used in mining operations. In all, about 3,000,000 cubic yards of earth are to be moved. Steam shovels, it was estimated, would have been impractical. The ocean is 500 feet below the scene of the work and the streams are drawn up through four large centrifugal pumps turned by two 200-horsepower electric motors. The pipes decrease in diameter near the nozzles until a three-inch opening is left, permitting the water to be released at 120 pounds' pressure. The stream is directed in such a way that small cliffs are formed and undermined. Thus the weight of the layers above helps break down the material where it can be washed away. Most of the formation is of gravel, but when rock is encountered, dynamite is used to assist the water. The intake is 300 feet from the shore and sieves are placed there to prevent weeds and other foreign material from clogging the inlets. To clean the screens, a valve is opened and water in the pipes up the hill rushes back with such force that all matter that has accumulated around the net-

ting is carried away. It is expected that the task will have been completed within four or five months after the start. Only a comparatively small number of men and teams are required, and the chief difficulty in the undertaking lies in moving the water-supply pipes. They are cut into sections and welded together again at the new location.

WALL WITH LADDERLIKE STUDS 1699 KEEPS PLASTER ON

Lath are laid between notches in the metal studs of a patented wall now on the market, forming shelves for the plaster, which is easily applied and less likely to fall off. The studs are secured at the top and bottom

and are placed about three feet eight inches apart across the wall. The lath are spaced one and one-half inches. Walls of this type can be lined to insulate them

Dickson Development Co.
1699

Emt. dra W. Eulder, 1527 N. Mariposa Ave
Hollywood, Calif

against fire, dampness and noise and are said to be much stronger than the usual types of construction. The system is especially adapted to the use of metal lath, and since the studs are of metal, there is further safeguard against fires. A sound-absorbing material and air spaces are combined to keep out loud noises

"HUMAN" CLOCK LIGHTS LAMPS AFTER SUNDOWN 1642

Run by electricity, a remarkable clock invented by a Washington eye specialist, is almost human. It can be set to turn on the parking lights of an automobile fifteen minutes after sundown, regardless of the daily variation in the time the sun sets. No adjustments are needed except once in four years to account for leap year. It will turn the lights off at daybreak in the same way or flash show-window lights on at sundown and turn them off at dawn. The clock tells at what time the sun rose or set on the day of a person's birth, no matter how long ago it was, or it will indicate in advance what time the sun will rise or set any particular day for years to come. The mechanism is the development of an apparatus the specialist made years ago to turn on the lights for a "human eye" sign he placed outside his office. He first devised the automatic lighting and turn-off equipment, then worked out the details of the mechanism which alters daily the time for tripping the light switch. Outwardly, the clock does not look greatly different from others, but there are two small dials that are exceedingly important. One is for setting the clock at the

proper month and day when it is first started and the other for regulating the hour when the clock is to turn off the lights. It contains a self-winding apparatus operated by the house current. Should the electricity fail, the clock would still run for more than four days, the inventor declares. Government experts and others who have examined this ingenious contrivance are greatly interested in it.

Puller Set Up Ready for Removing Stumps: the Tackle in the Center Is Operated by Handle above Chains

CHAIN-SCREW STUMP PULLER SPEEDS CLEARING LAND 1770

Large stumps can be removed in a few moments and at a considerable saving of labor, according to reports, with a puller which has been devised for clearing cut-over forest land in Czechoslovakia. It consists of a tripod of stout wooden poles, each resting on a firm wooden base. From the center is suspended the pulling apparatus, chains to

go about and under the roots of the stump, and a screw rod with a handle, which is operated by two men who stand on top of the stump. Working the handle back and forth lifts the chains, the tension being taken up by a patent arrangement at the base of the rod. In ten minutes, pine stumps are uprooted and large beech-tree stumps are torn from the ground in twenty minutes, it is said.

Interior of a Bottle Works, Where Machines in Less Than Twenty Years Have Replaced a Highly Skilled Craft That Had Endured for Thirty-Five Centuries; the Huge Revolving Bottle Blowers Convert Molten Glass into Finished Bottles at High Speed, Their Output Depending Only on the Size of the Containers Being Blown

Electric Lungs That Mold Liquid Fire

Bottles, from Tiny Ounce Containers to Giant Carboys, Blown by Machine That Has Displaced Ancient Handcraft

By R. G. THACKWELL

A PAIR of mechanical lungs gather up a handful of molten sands, give a mighty puff of compressed air, sucked up by electricity, and out comes a completed bottle, ready to be cooled, corked and shipped to the druggist.

Ceaselessly revolving, the electric lungs pause for an instant, before the tons of molten glass in the furnace, grab a supply, puff it, while they swing around, into a finished bottle, drop the red-hot glass container onto a moving conveyor, and arrive back at the furnace again for another mouthful of white-hot liquid.

Twenty years ago there were no bottle-blowing machines. In every glass plant skilled workers, who had learned their trade as apprentices, dipped little iron blowpipes into the big clay pots of glass, gave them a twirl to gather a bit of the molten stuff, and with their lungs blew the bottle into shape.

The pot full of glass was a little bigger than those pictured in the tombs of Egypt's kings, and the blowpipe a bit better made, but, in its essentials, the business was no different than it was thirty-five centuries ago on the banks of the Nile; than it was in the glass blowers' street of Tyre before its destruction; or than it was practiced by the titled glass blowers of Venice in the Middle Ages.

Then the glass-blowing machine was perfected, and, almost overnight, the entire industry was revolutionized. At last reports, ninety-five per cent of all the bottles made in the United States were blown by machines, and the remainder represented odd shapes, in lots so small that it didn't pay to construct the necessary molds for quantity production.

The conquest of the ancient art is one of the most fascinating stories of American inventive progress. The hand process

Part of the Storage Yard at an Illinois Glass Factory Where Acres of Large-Sized Bottles and Carboys Are Stored in the Open to Meet Sudden Demands; These Are All Machine-Made

was slow and required the utmost skill. It took many hours to melt a batch of material, and when the pots were emptied, the blowers must wait until new ones were prepared. Today the furnace is fed continuously, requiring no waits for fresh batches, and the mechanical lungs of the machine never tire or wear out.

Anything, from a tiny ounce bottle to a huge acid carboy, holding ten gallons or more, can be blown on the same machine, the only difference being the quantity of the output—big bottles take more and small ones less time. The machines have six, ten or fifteen arms, each arm a complete bottle blower, with the fingers, lungs and mold of the old-time human worker.

On small bottles, a ten-arm machine will make a complete revolution in ten seconds, turning out a bottle every second. Change the molds to gallon size, and the output is reduced to a bottle every four seconds. The biggest carboy machine in the world, standing twenty feet high and weighing 240,000 pounds, makes a revolution every minute, and a carboy every six seconds.

The blowing of a bottle, however, does not complete its making, for it is equally important that it be properly cooled. Anyone who has poured boiling liquid into a glass vessel, only to

Illinois Glass Co.

Bottles Passing through the Filling Machine, Above, a Corner of the Packing Department, Where the Still Hot Glass Is Prepared for Shipping, and a Corking Wheel, Bottom, Which Displaces Much Hand Labor

have it crack under the sudden expansion of the layer of glass next to the heat, can appreciate the terrific strains set up by the cooling of molten glass into hard crystal. To offset this strain, the newly made bottles are cooled gradually in a long heated tunnel, called a "lehr." Moving down its length so slowly that ten or twelve hours are taken to travel seventy-five feet, the bottles finally emerge cooled to room temperature.

Any type of blown container can be made on a bottle machine, but some types are still largely made by other processes, notably fruit jars and milk bottles. Owing to their wide mouths, which permit removal of a collapsible molding core, most of these articles, like table glasses, are pressed. Some fruit jars, however, are already being blown.

The slim, straight vials in which the druggist supplies the doctor's pills, are another exception to the general adoption of the blowing machine. Instead of being blown from the molten glass, these vials are cut from glass tubes, but the old hand process has been replaced by machinery which draws a tube directly from the fur-

nace, pulling out mile after mile of uniform size and wall thickness, cuts it into lengths, and turns out finished vials, complete with bottom and corking ring or ridges.

The vials, and the druggists' prescription bottles, are put through an unusual cleaning process in the factory where they are made. So, when the druggist starts to compound a prescription he doesn't have to stop to wash the bottle.

"CAFETERIA" MINE SUPPLIES COAL TO ALASKANS

While much of the millions of tons of bituminous coal that underlies Alaska is difficult to reach, a rich deposit near the town of Healey is exposed so that now the coal may be loaded directly from the veins to the cars. Before the railroad built a spur to the mine, the company operating it hauled the fuel on bobsleds down the bed of the river which had exposed the deposits. Geologists estimate that it took thousands of years for the stream to cut through the hills and lay bare the streaks of coal which is now shipped to various parts of the territory.

Giving a Demonstration inside Motorbus Fitted Up as Tool Shop and Display Room for Prospective Purchasers

MOTORBUS USED AS TOOL SHOP FOR DEMONSTRATION

Products of an eastern tool-manufacturing company are exhibited in a motorbus fitted as a traveling shop. The coach contains a special electric generator for supplying current, to show how the power-operated pieces are handled, and is furnished with fans, upholstered seats and carpets for the comfort of visitors. Three men travel with the bus, a driver, an advertising representative and a demonstrator.

AIR-MAIL ROUTES FAST LINKING EVERY SECTION OF U. S.

Letting of contracts for several additional air-mail routes by the post office department is maintaining America's position as the leading air-mail country of the world. When additional lines, for which bids have been asked, are put in service, practically all of the more densely populated sections of the country will have air service. The original New York-San Francisco route, which will continue to be operated by the department, is supplemented, under the new law, by a network of contract lines. In the east a contract route connects Boston and Hartford with the New York terminal of the transcontinental line, while Cleveland, Detroit and Chicago are joined by the Ford planes, which also carry factory mail and small parts between the three cities. Chicago remains the main air-mail center, with the cross-country lines east and west, four contract lines already awarded, and two more to be let this year. The west is to have a line from Denver south to Pueblo, and already has routes from Salt Lake City to Los Angeles, Elko, Nev., to Pasco, Wash., San Francisco to Los Angeles and San Francisco to Seattle. The latter connects with one of the two foreign mail air lines.

FISHHOOK BOOK ON HATBAND PREVENTS LOSS

Fitted with several compartments for holding hooks, flies and other pieces of tackle, a durable book attached to the fisherman's hatband keeps the articles handy for use and less likely to be lost. The holder is secured tightly to the band, goes about halfway around the hat, is waterproof and is held in place with an elastic band.

Golfers Wearing Detachable Treads Find the Going Easier When the Course Is Soft; the Cleats Do Not Damage Turf

DETACHABLE NON-SLIP TREADS FOR SHOES

Common shoes are converted into pegged soles for outing and working purposes by means of a pair of detachable steel treads now on the mar-

ket. Not only can they be removed but are also adjustable to different sizes, quickly clamped on and durable. Golfers, fishermen, workers, hikers and hunters are spared the necessity of buying a special pair of shoes with these attachments.

BIRDS AS BUILDERS OF HOMES RIVAL MAN IN SKILL

While men pride themselves on their ingenuity in construction, a glimpse at the world of birds reveals that they long have been skilled in the art of building. For instance, some are plasterers and carpenters, others are weavers and stitchers and still others have learned how to erect canopies to shield them from adverse weather and from enemies. The titmouse weaves an insulating material to protect its eggs from extreme temperatures. Robins and other birds are experts at repairing and renovating old nests, and some species display amazing skill at selecting the most suitable locations for their homes. The brown heron builds a three-room house, and the bower bird fashions play spaces of grasses and twigs.

ARTIFICIAL HORIZON ON SHIP AIDS IN ICE PATROL

Horizon Instrument in Use, and View of Interior, Showing the Mirror and Holder

The gyroscope has been further adapted to making navigation safer and simpler in an artificial-horizon apparatus recently installed on the "Modoc," a United States coast-guard cutter detailed to the ice patrol in the northern Atlantic. By means of this instrument, readings can be taken from the stars or sun when visible, even when the natural horizon is obscured by fogs. It consists of a highly polished mirror, mounted on a gyroscope, and a pendulum. The gyroscope keeps it at a uniform horizontal position in spite of the movements of the ship. Another type of artificial horizon has been used for some time on land. It consists simply of a bowl of mercury which is kept free from dirt and impurities and absolutely motionless. Movements of the ship precluded the use of such an apparatus at sea, but the mirror and the gyroscope are said to have solved the problem. In addition to this equipment, the "Modoc" will carry a radio compass and four transmitters.

FLAKED GLASS IN OFFICE DOORS MADE LIKE ARROWHEADS

In manufacturing the flaked glass used in partitions and doors, a process similar to that employed by the Indians in making arrowheads from flint is followed. An automatically controlled gas furnace is

used instead of a fire, but one of the basic principles, that of contraction, is the same. The Indians let drops of cold water fall on the flint after heating it, each drop causing a chip of the stone to fly off because of the sudden contraction. In making the glass, it is first sandblasted to give it a frosted surface, then coated with glue and subjected to gradual drying in the oven. This causes the adhesive to shrink and pull small flakes of glass with it.

GAS FLAMES PURIFY SOUNDS FROM PHONOGRAPH

Gas flames are known to be extremely sensitive to sounds and now an eastern inventor has made practical use of this fact by applying it to a phonograph, a utility company reports. Gas is introduced directly to one side of the diaphragm in the sound box of the instrument, passing thence to an upright U-shaped burner. The sound waves from the diaphragm are transmitted to the gas which is consumed in a series of small jets on the two arms of the burner. While a record is playing, the pulsation of the flames indicates that they are being used as a reproducing medium, softening and purifying the tonal quality. When the gas is turned off the tone becomes flatter.

AID FOR PERSONS PARTLY DEAF REQUIRES NO BATTERY

Ordinary conversation and musical tones are said to be magnified without buzzing or distortion in a small attachment for the hard of hearing that has no cord or battery and is not conspicuous. Its theory of operation is illustrated in the accompanying diagram. The balls in the upper drawing are numbered to conform to the hearing attachment's chambers represented underneath. If the largest ball is struck first, the force is

communicated to the others, causing the smallest ball to swing more than the largest. Sound impulses are thus amplified in the chamber next to the ear.

Ceaseless Study of Collections from Every Section of Globe Solve Secret of Exterminating the Harmful

By EMMET DOUGHERTY, 514 Woodward Bldg.
Washington 20 C

NO CO CANNIBALS and slaves, murderers and beggars, narcotic peddlers and drinkers of nothing but pure alcohol, 300,000 kinds of different beings, each with its own peculiar traits, are numbered among the moths, butterflies, beetles and other insects that are stored away in the vast fireproof vaults of the Smithsonian Institution.

Here, in the midst of the world's most valuable single collection of insects, scientists are constantly at work studying and classifying, probing into the life habits of each, in order that the good insects may be turned against the bad, to make the world a better place to live.

From Asia the Japanese beetle found its way to this country and in a few years threatened untold damage to agriculture. The scientists poring over their cases of mounted insects and studying the life history of each discovered that an insect called the ladybird bore a grudge against the Japanese beetle. Promptly the army of the ladybirds was augmented a thousandfold through subsidy by the government of the United States, and in millions was then turned loose on the unsuspecting visitors from Asia. A sanguinary battle started on a hundred fronts, and is

still raging, with the prospect that the sheer weight of ladybird numbers, plus healthy appetites for Japanese beetles, will save the farmers. In California one county has established its own army of ladybird mercenaries, raises them on a ladybird farm and sells them at cost, a cent or two each, to the fruit growers.

Three hundred thousand different species of insects appears to be a number past imagining, but it represents less than half the known species, and probably not more than one-twentieth of the existing kinds. Scientists, at the last count, had classified 640,920 different kinds, one-tenth of the world's total, and were adding to that list at the rate of some 6,000 species a year.

As they classify and study them, separating the harmless from the bad, and the good from the harmless, they also seek for the antidote, poison or enemy, to attack the harmful. So far the worst enemies of any insect are other insects.

Dr. Austin Clark, curator of the institution, who has made a special study of the life habits of a vast number of classes, in his writings on "Animals of Land and Sea," tells many of the queer habits, unusual tastes and strange alliances that exist in the insect world.

At the Left, Wheel Bugs. Raised in the West and Sold to Fruit Growers to Attack the San Jose Scale; Above, at the Right, Is an Aviator's Fur Helmet with Almost All of the Fur Eaten Away by the Common Clothes Moth, While Its Larvæ Have Begun to Attack the Leather; Below Is the Male Gypsy Moth

"As an exclusive diet," he says, "red pepper would seem to most of us to be quite unattractive, but there is one beetle which will live happily all its life on red pepper with never a thought that it is doing anything out of the ordinary."

Many of the beetles and other insects are cannibals, living on their weaker relatives; others are murderers who prey on other species. "All spiders," says Dr. Clark, "aside from certain mites, and all scorpions and centipedes are throughout their lives carnivorous, catching and devouring insects of various sorts, and sometimes other creatures."

"Beggars never making any attempt to work, and indeed incapable of doing anything at all, occur among insects," the Smithsonian curator continues. "Beetles of this description live in ants' nests where they are cared for by the ants with as much solicitude as if they were their own young."

"Helpless beggars asking charity are one thing; energetic and powerful ruffians enforcing charity quite another. Certain ants come in the latter category. Beyond raiding the nests of other ants, killing the

workers and carrying off the pupæ, they do no work.

"Narcotic peddlers have their representatives among the insects. There is a curious bug in Java which feeds on ants. When an ant approaches it rises up, exposing some long hairs on the underside which are wet with a secretion from some special glands. The ant greedily licks off this substance, which, however, is intoxicating. When the ant has had enough to make it 'groggy,' the bug with its sharp beak stabs it suddenly through the neck and sucks its juices out."

Equally curious are the habits of the tiny, pale fly which buzzes around fruit, and especially grapes, which hold the greatest attraction for it. The little fly lives entirely on an alcohol diet, getting it from the fermenting particles of a bruised grape.

BIG LETTER SENT BY AIR MAIL MARKS POSTAL PROGRESS

Days of the pioneers were recalled recently when a pony-express postage stamp appeared in the mails, but it was a huge replica of a real stamp and

made and the work is done at greater heights. In New York, for instance, a crew of eleven riggers was required this season to set up the trapezes. Close to the roof at times, they were eighty feet above the floor, hanging from slender girders by their

was attached to a monster envelope bearing greetings from the mayor of Los Angeles to the mayor of New York city. The occasion of its sending was the opening of air-mail service between the two coast cities. The new line to Los Angeles makes connection with the main aerial route at Salt Lake City.

knees now and then, in order to tighten this rope or loosen that stay to give the set the proper rigidity and "give," for a nice

RIGGERS OF CIRCUS TRAPEZES FACE MANY PERILS

If you will step under the "big top" early the morning the circus reaches town, you will see a number of agile, over-alled figures perilously swaying on slender supports high above the ground. They are busy rigging the intricate cables and braces for the aerial-trapeze set, on which, later, the spangled acrobats will perform their death-defying leaps and turns. No blaring bands or applauding crowds greet the riggers, although they often do stunts far more dangerous than those of the aerial actors and without a lifenet below to protect them in case they should fall. Upon their skill and thoroughness depends much of the success of the trapeze act and perhaps the lives of the performers. At Madison Square garden, in the Coliseum in Chicago, and in other indoor auditoriums where the circus is held, the riggers face even greater risks than under the canvas, for special adjustments must be

balance of the two is essential to the success of the act. In all, some 265 sets of cables had to be rigged and tested. Many acrobat troupes endeavor to hire the same riggers season after season if they prove efficient, for the error of a "green" or careless man may be disastrous.

BABY ELECTRIC WASHER FITS INTO SMALL APARTMENT

Intended especially for small homes or apartments, a light and compact electric washer will hold the equivalent of six shirts at one time, operates at three different speeds from a lighting socket and is said to make little noise. When running, a plunger mounted a little off center cleanses the wash.

FABRIC OF HOLLOW FIBER RETAINS WARMTH

Consisting of minute hollow fiber tubes, made of the same material as artificial silk, a new fabric for clothing has been tested by the bureau of standards. Its threads are said to be more opaque to light than solid ones, permitting a lighter and thinner weaving for the same covering power and practically the same strength. The chief advantage of the material is in its warmth-holding properties. Wool, feathers and other coverings are effective in that they keep a warm blanket of air close to the body, while other fabrics permit too much circulation or allow the heat to escape. The hollow-fiber fabric imprisons air in its tubes so that clothing made from this material is expected to be warmer than that from many others kinds of cloth. The bureau has been studying the new fabric in connection with tests on blankets of different types and for various purposes.

FIND SLAVERY STILL EXISTS IN AFRICA AND ARABIA

Traffic in slaves still flourishes between Africa and Arabia, according to Sir Frederick Lugard, a former governor of Nigeria. It is estimated that as many as 30,000 human beings are sold into servitude yearly in that part of the world and the slave trade is said to be rife also in certain parts of Morocco, in the Libyan desert and in Angola. Whole areas are reported to have been denuded of inhabitants because of the traffic from Abyssinia to Arabia across the Red Sea. Over two years ago, a body of experts was appointed by the League of Nations to investigate slavery conditions and find ways whereby it might be wiped out.

An Unusual View from the Woolworth Building; Looking Down on Window Washers Hard at Their Spring Cleaning

WINDOW-CLEANERS RISK LIVES AT DAILY TASK

Washing the grime from buildings in New York city proved an unusually difficult task this year after the winter of soft-coal burning and called attention to the workers who daily risk their lives in cleaning the windows of tall skyscrapers and other parts of lofty structures. From the fiftieth story of the Woolworth building, the window washers could get an unusual view of Broadway while at their task. The annual cleaning bill for cities throughout the country runs into millions.

ANCIENT CHINESE TEMPLE BELL RUNG WITH LOG

Curious Chinese Temple Bell; It Was Rung with a Log Struck against Projecting "Buttons"

One of the latest pieces added to the collection of the American museum is a Chinese temple bell cast about 1,000 years before the Christian era. It differs from modern chimes in that it is elliptical in shape and has no clapper. To strike it, a wooden log was swung against one of the projecting "buttons" producing different notes which are thought to have been used to tune the temple orchestra.

BARN SWALLOW AND BOBOLINK — WINTER SOUTH OF EQUATOR

Further interesting facts concerning the migratory habits of birds have been gathered by Dr. Alexander Wetmore, assistant secretary of the Smithsonian institution, who has returned from the southern countries of South America after a study of this phase of wild life. He found that the common barn swallow and bobolink go

Washington, D.C.

south of the equator for the winter, making their homes in the palm groves of Argentina and Uruguay. Then they return from the land of the tango and wing their way back thousands of miles to the United States and Canada. This long flight, twice a year, is considered remarkable, as these birds are not commonly regarded as distance fliers and most of the kinds that go south, stop north of the equator. Among these are the yellow-billed cuckoo, cliff swallow, olive-beaked thrush and nighthawk, which are of more or less common occurrence in the northern part of South America, but not found in abundance.

COUNTERBALANCED MOTOR SAW HUNG FROM CEILING

Easily moved to any part of the shop, a motor-driven saw now on the market can be used either vertically or horizontally and is adapted to cutting steel, wood or bone in much less time than is required with the ordinary tool. In a test, it severed a one-inch soft-steel bolt in fifteen seconds, while two and one-half minutes was the time required with a handsaw. It is suspended by a cable and counterweight and may be adjusted from the ceiling to almost any position on a workbench.

Why Hunters' Guns Blow Up

How to Avoid Accidents with Your Rifle, Pistol or Shotgun by Proper Care

By CAPT. EDWARD C. CROSSMAN, *Brentwood*
Wright, Calif.

SEVEN million persons went hunting last year. A few returned with the wreck of what was once a good rifle or shotgun or pistol. Some of them came back minus a finger or two. A few occupied space in the obituary column.

It is not surprising that some of the great army of firearms users come to grief. The guns they use develop terrific internal pressure when the trigger is pulled. Few steam boilers develop more than 400 pounds a square inch, but the lowest pressure in a gun barrel, when a shot is fired, is that of the shotgun, and this may run as low as 6,700 pounds a square inch. The highest pressure is that of the military type of rifle which develops from 45,000 to 50,000 pounds per square inch of chamber area. So it is not surprising that ignorant or careless people come to grief when using engines of such power.

Most guns are perfectly safe when used with the loads intended for them and when the barrels contain no obstruction, such as mud, snow, cleaning rags, brass brushes or shells of smaller gauge, which may be dropped into the chamber and stick in the bore of the gun. Gun and ammunition factories say that ninety-five per cent of the trouble is the fault of the user.

There have occurred the past few years, however, a number of accidents not at all the fault of the user, since the development of a new variety of shotgun powder which gives high pressures farther along the length of the barrel. Some of the cheaper guns or those designed many years ago with very light barrels, have failed to stand the pressure of the "progressive-burning" type of shotgun powder. Therefore, it is well for the shotgun owner

not to attempt to shoot the heaviest loads out of very old, cheap, or light shotguns, even though these loads are sold in every store and are entirely safe in guns designed for them.

The first health hint for the firearms user is never to try to shoot an obstruction out of the gun barrel. The second is to look through the barrel or pass a rod through it any time there is any doubt—such as a misfired cartridge, or a report that sounds wrong or a shot that fails to hit or give any indication that it has left the gun.

A great number of accidents occur when the first shot is fired, indicating that a cleaning patch, a brush, or even a coating of heavy grease had been left in the barrel. Also there is the chance that somebody may have tinkered with the gun. The small boy or girl might have dropped something down the muzzle.

A coating of heavy grease is very likely to blow up or bulge the barrel. The grease tends to dry, and it piles up in front of the wad or bullet, until it offers enough resistance to burst or injure the barrel. Light oil in the bore does no harm, but no gun should be fired with heavy grease in the bore, fresh or old.

Contrary to popular belief, sealing the barrel of a gun does not necessarily blow it up. One can stretch thin paper tightly over the muzzle of a gun without bursting it. What causes a barrel to blow up is some weighty or sticky substance that

will check the speed of the shot or bullet and set up what is called "wave action" in the powder gases following down the barrel. An inch of sticky mud in the bottom of the barrel of a shotgun, but not at all sealing the bore, is enough to blow it up.

Experts Blew Up the Second Barrel to See What Wrecked the First; a Double Load of Dense Powder Caused the Havoc

A shotgun shell that does not sound normal or kicks or misfires should stop all shooting until investigation is made. At times a defective primer, or an insufficient load of powder, has force enough to push the load of shot and the wads out into the barrel, but not enough force to drive them clear through. The next shot may burst the barrel.

Another cause for blown-up shotgun barrels is that the base wad, a cup-shaped cardboard piece that forms part of the base of the shell, is not held firmly in the shell head, and is drawn up into the bore of the gun. The next shot is likely to bulge or burst the barrel. Many old hunters blow through the barrel each time they open the gun. Any obstruction would cause the fumes of the powder, remaining in the barrel, to puff back into the face and cause the shooter to look

through the bore and remove the base wad.

Each year a certain number of shotguns are blown up through their owners' carelessness in loading their own ammunition. Two distinct sorts of powder are used in shotgun shells. One is "bulk," designed to use the same space in the shell as the older black powder and giving the same pressure and performance. This is loaded with a measure. The other is "dense," of which Ballistite and Infallible are examples. They take up very little room—about a third of that used by a charge of bulk giving the same pressure and speed to the shot. They are loaded by weight and are very powerful.

If the man who loads his own shells gets a can of dense powder and loads a lot of it into his shells by a bulk measure, he puts in roughly three times as much as he should, and the result is naturally a blown-up gun.

The man who falls down or drops his gun and finds the muzzle full of mud, had best postpone his shoot until he gets it out. It is not enough to be able to see through the barrel after poking some of the mud out. It must be removed until there is not enough remaining to pile up and check the speed of the shot and wads.

The pistol or revolver is the next on the list of guns liable to be damaged in firing. This is a type of weapon that is likely to be put away loaded for weeks or months

An Overload of Powder Blew Out the Chamber in the Oval; This Is the Only Way an Overload Damages a Shotgun; the Small and Large Pictures Show Shotguns Wrecked by Obstructions

at a time. Light oil, or some of the more subtle fluids used in compounds for cleaning and preserving guns, works in between the bullet and brass case, or at times around the primer in the base of the shell. Oil is fatal to smokeless powder and to primers.

The result is that when the gun is snapped, the powder usually fails entirely to burn, and a misfire results. The bullet is more likely to stick in the barrel. If the user does not notice this, he may fire a second shot, either driving out the first and bulging or splitting the barrel, or else piling up behind the first bullet.

The user of a revolver or pistol getting a miss, or of an automatic pistol that suddenly fails to operate and throw out the empty shell, should stop and make sure the bullet has left the barrel. A pistol put away loaded for weeks at a time should be filled with the special oil-proof ammunition or else the chamber and barrel should be wiped entirely dry of oil or nitro solvent, which wiping is likely to cause the gun to rust, from the resulting unprotected steel.

ONE AMERICAN HOME IN FIVE HAS VACUUM CLEANER

Just how far electricity has been adapted to removing the drudgery of household tasks is indicated by the results of a nation-wide survey of the use of domestic electrical appliances. The figures, gathered by a large publishing firm, show that one American home in every eight has an electric washing machine, one in every five a vacuum cleaner and that more than 125,000 electric dishwashing machines are now in use, their sale during the last year having increased to more than double that of any other two preceding years. Approximately, 5,000,000 vacuum cleaners and 3,500,000 electric washers are now in use in the 26,000,000 homes of the United States, the survey showed. The value of these products for one recent year is reported to have exceeded \$20,000,000.

Making Out a Receipt for a Driver Who Has Paid His Fine in the "Cafeteria" Auto Court

Holding Stick of Wood in Path of Rays from Huge Searchlight to Test Their Heat

NEEDLES OF LIGHT PIERCE FOGS TO AID SHIPS AND PLANES

Rays from a powerful projecting searchlight devised by a California inventor are said to penetrate fogs like gigantic needles for the guidance of ships and airplanes. The effect is obtained by combining an arc light with a reflector which is said to concentrate the full light power it receives to a distant focal point. The heat is so intense that a piece of wood placed near the arc is quickly ignited.

"HELP YOURSELF" AUTO COURT SAVES TRIAL DELAYS

Chicago autoists who break traffic rules are spared the delay that usually attends the appearance before a judge in a "cafeteria" court. The arresting policeman gives the offender a slip. If the violator pleads guilty, he goes to the special court where he is assessed a fine, and is permitted to go as soon as he has paid the amount. He is given a receipt for the transaction and a record is kept by card index.

READING MACHINE TO AID EYES AND REDUCE COST OF BOOKS

Bulky volumes can be condensed into small pamphlets and readers will be spared eye strain, it is asserted, by using a read-

Fiske'scope

Rear Admiral Fiske Holding His Reading Machine, and in the Background, a Sample of the Printing

ing machine invented by Rear Admiral Bradley A. Fiske, retired. Admiral Fiske has a number of successful inventions to his credit, including an electric gun-range finder, a torpedo plane, the naval telescope sight and a system for exploding torpedoes under ships, and believes that his reading apparatus will make eyeglasses unnecessary for the majority of readers who now use them. The instrument consists of a pair of small spring tongs with a lens for one eye and a shield for the other, together with a rack for holding the reading matter. This is produced directly from typewritten manuscript by a photographic process and is so small that it can scarcely be deciphered with the unaided eye, but is easily read under the lens. A sample prepared by the inventor illustrates

the size of the type. He had the entire first volume of Mark Twain's "Innocents Abroad," a book of 93,000 words, prepared into a small pamphlet of only thirteen pages, three and three-quarters by five and three-quarters inches with wide margins. Admiral Fiske declares that the apparatus shields the eyes from extraneous light, makes continual focusing unnecessary, keeps the printed matter at the correct distance from the eye and permits the eyes to retain their normal position in the head. One eye is just as good as two for reading, he asserts, as both are needed only in judging distance, and he points out that the finest work done by the human vision is usually performed with but one eye, as in telescopic and microscopic observations. Comparative tests showed that there was no loss of speed in using the machine, even though the reader was unfamiliar with it, and that there was less eye strain. Should the instrument become widely adopted, the inventor believes it would result in drastic changes in printing and book manufacture and would permit great saving of space in libraries. It is recommended that the system be first adapted to bulky reference works. One precaution is regarded as essential in using the machine: The page must be well illuminated as closing one eye shuts off about half the light. The instrument resembles a lorgnette.

PLANS TRANSATLANTIC TRIP IN AIR-PROPELLER BOAT

Motive power for a novel craft a Frenchman has built for a voyage across the Atlantic is supplied by a 180-horsepower motor turning an aeroplane propeller. The designer expects a speed of about ninety miles an hour in the open sea. He plans to leave from Marseilles and land at Pernambuco, Brazil, making a total distance of more than 6,000 miles.

HOW ACCIDENTS HAPPEN IS SHOWN IN PICTURES

New York's Violent-Death Record for 1925 at a Glance; the Figures and Drawings Were Prepared from Health-Department Reports and Covered the Principal Causes of Fatal Accidents

Picture diagrams of how 5,581 persons met with violent deaths in New York city, during 1925, showed that highway accidents claimed by far the largest number of victims with a total of 1,272. The few deaths from football and baseball, only seven for both sports, were a feature of the report, as was the number of fatalities due to kicks from horses, five persons being killed in that manner, apparently substantiating Maj. Schroeder's contention that the mule is more deadly than the airplane, which claimed but one victim in New York last year. The figures and diagrams were compiled according to statistics gathered by the department of health.

WOOD WASTE PROVIDES POWER —WHEN GROUND INTO FUEL

Wood refuse is now being used to turn the wheels of a large manufacturing plant. Rubbish that was formerly disposed of at a cost of more than \$1,800 a year is being burned under the boilers as the result of a new system. Wood scraps are passed through a grinding apparatus that removes all nails and reduces the material into fine particles. From this machine, it is conveyed by suction through a charger into a conveyor line which terminates at the power house. Here, a specially designed storage bunker with a capacity of 3,200 feet receives the refuse which is passed through a stoker into the furnace.

By means of a paddle-wheel feeder, the storage bunker is kept from catching fire and the wood is consumed while in suspension and burns with no smoke or ash.

BURNER IN GAS WATER HEATER REMOVABLE FOR CLEANING

Cleaning a gas water heater now on the market has been simplified, for the burner and mixer may both be removed without using a wrench or breaking the gas connection. Particles of soot or scale that

soon would clog the apertures are caught on a deflecting cone built into the burner so that they do not fall upon the gas ports, and the flame is prevented from impinging directly on the bottom coils or fitting. During a

test, one of these heaters was burned continuously for 3,294 hours, about three times as long as the usual kind, before the coil sprang as much as a small leak. In this period, 395,316 gallons of water were heated and 221,085 cubic feet of gas consumed. Though the burner was not cleaned during the test, no trace of carbon monoxide was found in the flue gases.

The projectors are so set that glare is eliminated and equal distribution of light is achieved. There are 125 tracks and 11,500,000 square feet of ground in the area.

SHORT LENGTH PHONE BOOTHS CLEANER AND SAVE ROOM

Telephone booths being marketed by a California concern are short, circular compartments to be fastened

Booth in Use and Open; It Fits Snugly about Patron but Permits Ample Ventilation

against the wall and are about two-thirds open at the bottom, to permit free circulation of air. The door closes quietly and automatically and as the person's body partly fills the space below the booth, outside noises do not greatly disturb him in using the phone. This arrangement takes up less space than the usual closet form of booth and it can be installed almost anywhere a wall is available.

WARSHIPS ARE MADE SECURE AGAINST BOMB, TORPEDO

By adding an external hull of shell and a third bottom to big battleships, and by strengthening the deck armor protecting machinery and other vital parts, engineers hope to make the dreadnaughts almost unsinkable. The work is to be done on six big ships of the United States fleet with an appropriation of \$18,000,000. By using materials from scrapped vessels, a saving of nearly \$300,000 will be effected on each ship, it is predicted. According to some naval experts, the battle of Jutland proved that the most formidable adversary of a modern fighting craft is not the airplane or the submarine but another ship of the same type as the war vessel itself with superior power of guns and greater speed. Experimental tests later showed that it took a number of bombs dropped from a plane to sink a motionless, helpless ship, whereas, in the Jutland engagement, three capital vessels were sent to the bottom in rapid succession

The Jep-Lo-Phone Booth Co., 1301 Third St. Santa
Jep-Lo-Phone Booth Co., Ledger 3/26/26

while moving at great speed after an exchange of a few salvos from the heavy guns. The "blister," or external hull, is said to reduce greatly the effects of a torpedo or bomb explosion. It is constructed of heavy plate steel and is subdivided into hundreds of chambers or compartments which are intended to "cushion" the detonation. It also serves another purpose. Should one side of the hull be torn open by a bomb or torpedo, the other side could be filled with water to prevent the vessel from listing and permit regaining the normal plane, unless the damage were too severe. The bulbous shape produced by the external hull is also expected to provide a more stable platform from which to fire heavy guns with greater accuracy. The dreadnaught "Arkansas" is now in dry dock, being equipped with this additional protective armor. To shield against vertically dropped bombs, virtually two complete decks of heavy steel have been laid over the original deck from bow to stern.

1535

RUBBER PROOF AGAINST ACIDS NEARLY STRONG AS STEEL

Tests conducted at the bureau of standards with a new rubber developed for commercial purposes show that it has almost the tensile strength of steel and is also proof against acids. To determine its qualities, it was put through severe stretching and other tests while records were kept of the number of pounds it would hold, the amount it yielded and other data.

One of the Strength Tests on the New Rubber; It Proved Nearly as Strong as Steel and Is Acid-Proof

Canopy and Realistic Tree Stump Built of Concrete

CONCRETE ORNAMENTS IN PARK RIVAL NATURAL GROWTHS

Attractive little seats, tree trunks, and other objects used for decorating a park in a Texas city, have been molded of clay and cement with such realism that they deceive the eye and must be touched to determine their true nature, those who have seen them declare. Over a rough form or framework, the clay is applied and then topped with a cement coating for permanency. Colors are used to add to the naturalness of the effect, and such details as worm holes, frequently found in old wood, have not been overlooked. The decorations are executed by a young Mexican artist whom the park commissioner engaged to do the work after he had conceived the idea of using this special form of cement art to beautify the grounds.

PLAYER CARRIES PIANO IN CAR TO KEEP IN PRACTICE

While taking a long railroad journey, a musician kept in training with the aid of a small piano that fitted into the sleeping

Practicing Her Music Lessons While Traveling on Train; the Piano Fitted in Car

car. The instrument also permitted rehearsals, thus saving considerable time that would have been lost during the trip.

OIL IS LOCATED WITH WEIGHTS AND "BUGS" IN ROCKS

Two interesting new methods have been developed for finding oil. One hinges on the fact that objects do not weigh the same in all localities and the other has arisen because certain families of minute sea animals died centuries ago and left their tiny shells in the rocks. In the first method, use is made of what is known as the torsion balance, an instrument invented a quarter of a century ago by a Hungarian

scientist. It is so delicate that it measures the direction and intensity of gravity at any point on the earth's surface and shows that things do not weigh the same at different places. This is partly attributed to the variation of the density or specific gravity of the rocks below the surface. Objects above rocks of great density weigh more than they do above those of smaller specific gravity. The balance thus affords a clue as to the character of the material below the top, leading sometimes to the discovery of formations of light specific gravity, such as salt domes where oil frequently is found. The "bugs," or foraminifera, have been classified by scientists so that the strata where they are found can be identified. Geology teaches at about what depths these strata should lie. If they are found at widely different levels, the prospector knows that a disturbance has occurred, and that there is probably a fault in the earth's crust, a sign to be on the lookout for oil.

REVOLVING GATE ON PIVOT POST OPENED BY AUTOMOBILE

Doing away with the inconvenience of getting out of the car, a revolving gate now on the market is opened when the automobile is bumped gently against it and swings shut again when the vehicle passes through. It is solidly constructed of wrought-iron pipe and wire or wood, and rides on circular cams attached to the pivot post in the center. When pushed, the gate rises on the uphill slope of the cams. Past the center, it encounters the downward slope and so closes by gravity. Sagging is eliminated and it will not open under the pressure of heavy winds.

Something to Keep the Airplane Pilot's Eyes off the Scenery; the Instrument Panel of an Army Bomber, with a Few Experimental Devices Added to the Regular Equipment

Guiding the Lost Flyer Back Home

Better Instruments Solve Problems of Night and Fog Flying, Make Reading Easier and Remove Danger in Event of a Crash

By E. F. BACON, *30 Lawn St. Weymouth, Mass.*

THE development of instruments as an aid to aerial navigation has closely paralleled that of the airplane itself. The Wright brothers, in their early attempts to fly, soon realized that successful flight could be performed only by using mechanical devices to aid their senses. Their experiments along this line soon resulted in the birth of the first aeronautical instrument which was merely a strip of white cloth tied to one of the struts. During flight this strip was carried straight back by the rush of air and the angle it made with the strut showed the inclination of the plane with respect to the air.

As the airplane developed, it became necessary to use more instruments to obtain the best performance. The engine, being a vital part of the craft and yet subject to frequent failure, required almost

constant supervision. This supervision could not be of the hit-or-miss type, because a dangerous symptom, such as a spurt of boiling water from the radiator or a violent knock, not only indicated that damage had been done but that there was no time to search for a landing field. It naturally followed that the engines were equipped with oil and fuel-pressure gauges and later with a thermometer and a tachometer. These instruments gave the pilot sufficient warning of trouble so that he was enabled either to correct the condition or search for a landing field. In addition to their use as a warning the instruments made possible more efficient use of the engine by assisting in obtaining and holding the best temperature and speed conditions.

In some respects the navigation of aircraft does not present the problems that

An Aid in Fog, the Flight Indicator, Which Tells Whether the Plane Turns or Pitches, and Replaces Horizon and Landmarks

marine navigation does, but in others, the difficulties are greater. Flying, with good visibility, over land where an abundance of landmarks affords a constant check on the position of the plane is fairly simple, but over water, barren lands, or during darkness, fog or rain, the obstacles are almost insurmountable. The winds that carry aircraft off their course vary in direction and value from hour to hour, and even change with altitude. The airplane depends on the pilot for balance, and he, in turn, on seeing the horizon for his sense of balance. If this is obscured by cloud or fog, he must rely on instruments entirely.

Because of the nature of its mission, military aviation will always present more problems than civil. Well lighted airways, radio beacons, familiar country with frequent landing fields, good weather service, and the postponement of flights on the worst days, will rid civil aviation of most of the delays and hazards. The military aviator, however, must be prepared and equipped to navigate over strange and hostile country, at night and under all conditions. He must be capable of flying several hundred miles to sea on scouting and bombing trips and return to his base. For these reasons the military airplane equipment will have to be more complete than that carried on the commercial type.

The modern instrument board is divided approximately into halves, the left side being used for the group of instruments concerning the engine, and the right side for the instruments used in navigating the plane. The engine instruments include the oil and fuel-pressure gauges, water thermometer, tachometer, ammeter and ignition switches. If the plane has a supercharged engine, there will also be an instrument to tell the pressures at which the engine is being supercharged. The navigation instruments in-

clude the air-speed meter, compass, altimeter, clock and flight indicator or turn indicator. Under normal weather conditions the pilot does not attempt to observe these instruments all the time, but glances at them occasionally to reassure himself that the engine is functioning properly and that he is on the right course.

The pressure gauges and the thermometer are similar in construction to those used on the better motor cars. The tachometer contains a form of watch escapement and counts the actual number of engine-shaft revolutions made in a certain time. This type of tachometer is free from the troubles commonly experienced in the centrifugal and magnetic types. The air-speed meter works on the following principle: If a tube is placed with its open end pointing ahead of the airplane, the air striking it will build up a pressure; when this tube is connected to a suitable gauge the speed of the airplane can be read off directly in miles per hour.

The latest form of airplane compass is the so-called earth-inductor compass in which the current generated in a coil rotated in the earth's magnetic field is used

to indicate the direction of the magnetic north. When flying in clouds, the pilot also must have some means of telling when he is flying a straight and level course. When no horizon is visible, one wing may drop or the airplane start a slow turn without the knowledge of the pilot. The rate of turn will gradually increase until the plane drops off in a spin. To aid him in such cases the pilot has the flight indicator. The actuating element of the instrument is a small air-driven gyroscope, which deflects against a spring when the plane turns. This deflection is communicated to a pointer which indicates the direction.

The lateral inclinometer consists of a steel ball rolling in a curved glass tube. When the airplane is not turning this indicates the lateral balance of the craft. If a wing drops a little, the ball will roll to the low end of the tube. The fore-and-aft inclinometer indicates the pitch of the plane. The pendulum in this instrument is controlled by a small gyro which only acts when there are accelerations present which would make a simple pendulum indicate incorrectly.

SEARCHLIGHTS FOR NIGHT WORK IN DIAMOND MINE

From fourteen huts on the rim of a deep craterlike hole in South Africa, shafts of light stream out every night to illuminate the diggings below where natives are toiling in the clay for diamonds. This lighting system has been installed at the Premier mines, where the famous Cullinan diamond was discovered, and consists of batteries of 1,500 and 2,000-watt lamps with filaments of the so-called "mono-plane" type. In front of each lamp is a 5¼-inch spherical mirror and each projector has a sixteen-inch parabolic mirror. Current for the lighting is distributed by four substations from a large generating plant. The lights have a range of from 900 to 1,600 feet for satisfactory illumination, and are considered a great advance over the old type of arc searchlights, which were constantly being damaged by the blasting operations. It is estimated that, at the end of 1924, the mines here had produced 23,500,000 carats of diamonds. The area is the "pipe" or vent of a former volcano, oval in shape, about 2,000 feet long and 1,500 feet wide. This entire section of some seventy-eight acres is being dug out and dumped on the surface of the land near by.

Like Short Stilts but with Spring Plungers, These Walkers Give Children Healthful Exercise

JUMPER WITH SPRING PLUNGER GIVES CHILDREN EXERCISE

Children are afforded healthful exercise and amusement with a pair of spring-plunger jumpers now on the market. They are easily put on and a boy can travel from ten to fifteen miles an hour with them, the manufacturers claim. The plunger is but four and one-half inches from the ground and is fitted with a strong spring, permitting long leaps. The jumpers are made in adjustable sizes for boys from six to sixteen years.

TEST HEARING IN MOVING CARS TO STUDY DEAFNESS

Persons partly deaf submitted to hearing tests on moving street cars in New York city not long ago, while physicians carefully recorded the results. The experiment was made in part to determine if the constant noise of the car had a beneficial effect on the subjects' sense of hearing. Those who suffer from this trouble often say that they can hear better on cars or other places where there is noise than in quiet rooms. This has been explained on the ground that, a steady noise does stimulate the auditory nerves in some persons to a certain degree, and when there is a disturbance, persons speaking to a deaf companion naturally raise their voices to a higher pitch than when the surroundings are quiet.

Extremes in Electric Locomotives; the Pygmy in the Foreground Is Run by Storage Batteries in Mining Work

CONTRAST IN ELECTRIC ENGINES IS PROOF OF PROGRESS

Visitors in the yards of an eastern manufacturing company saw an interesting contrast in motive-power units recently when the midget and the giant of the electric-locomotive world were set side by side. The former, a "mechanical mule" used in various mining operations, is only forty-one and one-half inches long with a capacity of but four and one-half horsepower, while its larger brother is 152 feet in length and develops 10,000 horsepower. It is to be used for hauling a loaded train nearly two miles long over a steep grade. The dwarf is run by storage batteries.

SEED GROWTH AIDED BY ACID BATH

As a result of interesting laboratory experiments performed by a Minneapolis woman on the seeds of wild flowers, thinning woodlands may be replenished of their fast disappearing stocks of natural blooming plants and the slogan "Don't Pick" may be replaced by the phrase, "Plant and Pick All You Want." It now appears that wild

flowers can be grown by artificial cultivation. So successful have been the first experiments that even the wild hollyhock, one of the hardest of all to propagate, has been made to put forth tiny green leaves in the laboratory. One of the difficulties encountered in making these seeds sprout is that they have hard coats. The experimenter solved the problem by removing the coverings. This was easy with the larger seeds but not with those of microscopic size. However, it was found that by soaking them in acid, they were liberated from their hard coating. The hollyhock seeds were treated for two hours in concentrated sulphuric acid. The artificial method may be even more efficient than nature, for it is estimated that, under normal conditions, only about one out of every 10,000,000 seeds of the wild flowers germinates. Several varieties were found to be especially easy to grow. These included the evening primrose, the yucca, wild teasel and the sullivantia, a saxifrage that grows in limestone ledges.

LIFE HARNESS FOR LINEMEN AIDS IN RESCUES

Linemen who suffer electric shock while at work can be lowered to the ground for resuscitation by means of a special harness that has been devised in Germany. It is worn under the shoulders and is so arranged that the victim can easily be let down in a perpendicular position. As in drowning, artificial-respiration methods are often effective in reviving a person who has suffered an electric shock, and linemen are sometimes lost simply because of delays in getting them to the ground quickly where aid may be given them.

Building a Simple Tube Tester

By HARRY P. LETTON

AN efficient and very simple tube tester can be built from odds and ends about the average radio experimenter's workbench. The main item of expense is the milliammeter. A good instrument can be obtained for

of X-socket can be used and mounted in the usual manner. Drilling the hole for the milliammeter is not so easy, but a circle, $2\frac{1}{8}$ in. in diameter, can be scribed on the panel with a

Tube Tester in Use; Detailed View of Front Panel Shown in Insert

about \$7. The other parts required are very simple and inexpensive; a 25-ohm rheostat, tube socket of the new X-type, six binding posts, switch lever and three contact points with stops. The panel can be of any insulating material, the size of this panel depending on the size of the case used. The case used in the model was an ordinary cigar box, $2\frac{1}{4}$ in. deep and of the size ordinarily used for 50 cigars. The lid was removed and the box scraped and sanded to a smooth surface; it was then stained a mahogany color, and varnished. It may be finished to suit the individual builder. The drilling template for the panel is given; the exact size of the holes will depend on the type of parts used.

The instruments are then mounted on the panel in the positions shown in the front-view photo of the finished instrument. The X-type tube socket used in the model was of the spring-suspended variety; the upper part to which the terminal connections are fastened was removed from the base, and mounted directly on the panel. However, any type

pair of dividers; small holes are then drilled around this circle close enough together so that the inner piece will fall out. A half-round file is then used to smooth off the edges, and the milliammeter fitted in place. The switch lever and contact points are then mounted as shown, and the outside contact points marked positive and negative exactly as shown on the template. The center point is dead. Binding posts with engraved tops can be obtained so that it will not be necessary to mark their positions on the panel.

The tester is now ready for wiring. The wiring diagram shows each instrument and the wires running to them will be found above the chart. This wiring is shown just as you would see it if the panel was transparent; No. 14 round, tinned-copper busbar wire is used for the circuit. All connections are soldered to lugs mounted on the terminals of the various instruments. The voltmeter, shown in the dotted lines, is optional and may be omitted to keep down the cost. It is important if exact tests on the rated filament voltage of the tubes are required, but for ordinary testing, the rheostat can be turned up to the usual tube brilliancy, or saturation point, as shown on the milliammeter when the switch lever is placed on the negative contact point. The bus-

bar shown between the C-positive and C-negative posts is merely a piece of wire shorting these posts when no C-battery is used. A C-battery is necessary for some tubes, as shown on the chart, when checked with certain B-battery voltages. It is a good idea to check the tubes under the same battery conditions existing in the set in which they are used; however, a 45-volt B-battery and A-battery of suitable size for the tubes to be checked are sufficient for ordinary tests with tubes of the 201A and 199-types.

The operation of a vacuum tube is dependent upon the controlling effect of changes in grid potential on the plate current. The filament may light as usual, yet certain defects may exist in the tube. The controlling effect of the grid may also be absent, and there may be internal shorts in the tube. If a tube is normal, a definite amount of current will flow from the B-battery to the tube when the tube is turned up to normal voltage. When the grid potential is changed a given amount, the plate current should change to another value, and the relative value of this change largely determines the value of the tube. When testing tubes with this instrument,

TUBE-TESTER CHART

connect the proper A and B-batteries to the binding posts, being careful to observe the correct connections. If no C-battery is specified on the chart, the C-battery binding posts should be left connected with the busbar wire. If a C-battery is specified, take out this short-circuiting con-

nection and put in the proper C-battery, observing the correct polarity. The C-battery enables the tester to be used on a greater range of voltages, and with the newer type of tubes. Turn the rheostat to the off point, and place the tube to be tested in the socket. The X-type socket will have two large holes for the filament prongs of the tube.

If the tube being tested is of the old type having the small prongs, determine which are the filament prongs before putting the tube in the socket. The metal pin on the side of the tube base is usually on the grid and plate side of the tube. If in doubt, place the tube in an extra socket to determine the position of the terminals and mark them on the base of the tube. With the old type of 199-tube, it will be necessary to use an adapter. Place the switch lever on the negative contact point and turn up the rheostat to the normal

voltage, or point of saturation, as shown by the milliammeter reading. Take this reading, which indicates the value of the plate current in milliamperes when the grid is connected to the negative end of the filament. Then switch the lever over to the positive contact. This shifts the grid from the negative to the positive filament, and the plate current will rise to another value. The greater this change in plate current for a given grid-value change, the higher the mutual conductance of the tube, and the better it is. These readings may be considerably higher than those shown in the chart; if so, good, but they should not be lower. Some tubes will be found to give much higher plate-changes than others.

If a tube has its plate shorted to the grid or the filament, a relatively heavy current will flow in the plate milliammeter, and the pointer will swing over to maximum very quickly. Should this occur, remove the tube at once to prevent damage to the instrument; should there be a short circuit between the grid and filament, no change whatever will be noticed on switching the lever from negative to positive, since shorting of the grid renders it inactive as a controlling element.

If the tube plate emission has fallen off, values of plate current will be materially less than those shown in the table, and

there will be a much smaller increase in the reading when the switch lever is thrown to the positive contact. Some tubes of low plate emission can be rejuvenated to almost their former value with any of the simple tube boosters now on the market, and when placed back in the tester will show much greater efficiency.

A large blueprint, including circuit diagram, battery connections and chart, may be obtained from the Radio department, Popular Mechanics Magazine, 200 E. Ontario st., Chicago. Include 15 cents to cover postage and packing. Specify blueprint No. 111.

Straight-Line Frequency Condenser Employs Coiled Plates

A new straight-line frequency condenser employing coiled plates

Dust-Proof Straight-Line Frequency Condenser Employs Two Shielded Plates in the Form of Coils

is interesting as a variation from the plate type in common use. It consists of two plates in the form of a clock spring; and is inclosed in a transparent, dust and

moisture-proof case. The terminals are taken out through the back of the case, making a very compact and neat unit; a 4-in. dial is supplied with each condenser.

Honeycomb Coils Ideal for High Waves

For high wavelengths, honeycomb coils make an ideal form of inductance. Bank-wound and honeycomb coils, on these waves, have comparatively low resistance, and are compact and easier to handle than the old type of solenoid coils formerly used for this purpose. The large amount of wire necessary in a coil that will tune to the high waves presents a definite mechanical problem, if space is to be conserved. A compact honeycomb coil, 1 in. thick and 5 in. in diameter, can only be duplicated in inductance value by a solenoid coil 3 ft. long by 6 in. in diameter—out of all reason in the modern set.

Kinks for Superheterodyne Builders

By F. L. BRITTIN

IN fulfillment of a promise made to our readers a short time ago, Popular Mechanics radio laboratory offers the following suggestions to 1926-model superheterodyne builders. A careful check has been kept on the inquiries received and the kinks or suggestions given in this article have been prepared in answer to them.

One of the most frequent requests is for a diagram showing how to use a.f. transformers in the 1926-model instead of the resistance-coupled unit, as many have these transformers on hand and do not wish to go to the expense of buying an additional unit.

The few changes necessary are shown in Fig. 1 on the blueprint page. A phone jack and filament switch are mounted on the front panel in the positions indicated. The switch is connected in the negative line; the a.f. transformers and extra sockets are mounted on the subpanel so as to permit as short leads as possible, the arrangement being shown in the rear-view photos. The exact position of these transformers will vary according to the types used. A ratio of 2 to 1 is suggested for the second stage; the first stage may be either 6 to 1 or $3\frac{1}{2}$ to 1, as desired, but the transformers must be of the heavy type now on the market if good results are to be obtained.

The maximum B-voltage required in this case is ninety; this terminal post is placed at the extreme left of the subpanel, and is connected to the frame or bottom blade of both the phone and horn jacks. A lead is also taken from this line to the B-positive terminal of the A and B voltmeters, and from the underside of the terminal post to the B-post of the second a.f. transformer.

It is also necessary to mount a $4\frac{1}{2}$ -volt C-battery on the subpanel, which is held in place by means of two small brass brackets; a binding post for the positive and negative leads holds these brackets in position as shown. A lead is taken from the negative-C binding post on the

underside of the subpanel and run to both F-posts on the a.f. transformers; the positive lead from the C-battery is then connected to the negative-A line. All leads are shown exactly as they appear in the laboratory model, and are very simple to follow; the light leads indicate those that are run below the subpanel.

To operate the set place two 201A tubes in the amplifier tube sockets, and turn on the switch. If the phones or horn are used in the phone jack, seven tubes are in use; the eighth tube is not lighted. Plugging the horn in the filament-control horn jack lights this tube. To control the volume on the horn jack, it may be necessary to turn back the detector rheostat on the first detector tube, or a volume-control horn plug can be used; this is a new device and is known as a "modulator horn plug." A small dial mounted on one side of the plug is adjustable so that the volume can be regulated from a whisper to maximum without touching any other control on the set.

The second largest number of inquiries received from builders of this 1926-model superheterodyne asked for some means of cutting out the resistance-coupled amplifier temporarily, so that phones could be used on local stations. Volume can be regulated by the modulator horn plug referred to above without any change whatever in the present circuit, but for those who wish to cut out the resistance-amplifier unit entirely, for using the phones, the simplest method is to mount an open-circuit jack below the horn jack, and run a lead from the frame or lower blade of the jack to the input B-post on the amplifier unit, and from the upper blade of the jack to the input P-post. Extra lugs can be mounted on these posts for this purpose and no connections in the set disturbed. A blank horn plug is then plugged into the horn jack to turn on the filaments of the tubes, and the audio rheostat is turned completely off; this cuts the amplifier unit with its three tubes out of the

circuit, and the phones can then be plugged into the phone jack.

Cutting one or two stages out of the amplifier unit is a little more complicated, but Fig. 2, in the blueprint diagram, shows a simple method especially designed for as few changes as possible. An open-circuit jack is mounted on the front panel just below the horn jack. The output B-lead is run to the frame or bottom blade of each jack, the upper blade of the phone jack being connected to a flexible lead which is taken to either of the points marked X on the amplifier unit. The schematic diagram of the unit shows these points to be plate leads of the first and second amplifier tubes. A soldering lug can be placed under the resistor-clip screw at either point and the flexible lead soldered in place. The tubes not in use can then be removed from the amplifier unit if desired. To use the phones or

will find the modulator horn plug will reduce the volume so that phones can be used on the 9-tube load if desired.

A C-battery is a necessary addition to all sets using any type of a.f. amplification, to conserve the B-battery. The newer resistance-coupled amplifiers are provided with C-battery binding posts, as shown on the amplifier unit in Fig. 2. The C-battery is shown above the unit properly connected. If 201A or similar tubes are used, a $4\frac{1}{2}$ -volt C-battery is required; if the Hi-Mu tubes are used, the No. 20 types are placed in the first and second sockets of the unit and a Hi-Mu No. 6 tube is placed in the last socket, but do not use these tubes in combination with 201A tubes. With these tubes and the specified 135-volt B-battery, a 9-volt C-battery should be used. For this purpose connect two of the $4\frac{1}{2}$ -volt C-batteries in series. If the 201A tubes are

Rear View of 1926-Model Superheterodyne Employing A.F. Transformers Instead of Resistance-Coupled Amplifier; Above, Enlarged View of Amplifier Section, Showing Distribution of the Units

loud speaker in the phone jack, place a blank phone plug in the horn jack to turn on the tubes, and plug the phones or horn in the phone jack below. Do not use Hi-Mu tubes in the amplifier unit when using the phone jack. Those who merely wish a volume control and do not care to go to the trouble of putting in the extra jack

used in the first two stages, and a 112-type power tube in the last stage, the same C-battery of 9 volts is used. For those that have the older type of resistance-coupled amplifier units, the C-battery posts are easily added. Referring to the schematic diagram, note the position of the negative C-battery connection, at the

POPULAR MECHANICS MAGAZINE
JULY 1926

Fig. 2
AUDIO
RHEOSTAT
— TO EITHER POINT MARKED "X" ON UNIT

Fig. 1

end of the last grid resistor; an inspection of the underside of the unit will show the resistor terminal connected with the A-negative post on the last tube socket, by means of a short metal strip. This metal strip is removed and two small binding posts are mounted in the place of the machine screws. The negative side of the C-battery is then taken to the post on the resistor clip and the positive side goes to the negative-A post on the last tube socket. The location of the C-battery posts on the upper side of the unit is clearly defined in the picture diagram of the unit.

A .0005-mfd. fixed condenser will be noted across the B and P input posts on the unit; also a 2-meg. resistor is substituted for the .1 resistor in the first input clip of the unit. With the by-pass condenser in position the r.f. current is kept out of the audio-amplifier unit and the resistor of higher value enables the operator to balance the set with ease.

Leaving the audio-amplifier section of the set, we will now consider the second detector. This tube can be either a 201A-type or a No. 20 Hi-Mu tube; a $\frac{1}{4}$ -amp. "amperite," or "ballast," is used for this tube instead of a rheostat. If this resistor unit is defective, the set will have poor volume and give unsatisfactory results. The intermediate-frequency tubes should be uniformly matched, and the grid and plate leads from the transformers to the tubes as short as possible. The first detector tube can be either a 200 or 201A-type, but preferably the latter. If this type of tube is used, a 25-ohm first detector rheostat should be used, the rheostat controlling this tube only. The B-voltage for the plates of the first detector and oscillator tubes should be kept at the original 18 volts specified; use the poorest tube you have for the oscillator. The low oscillator plate voltage prevents blocking of the first detector tube and is one of the reasons for the highly satisfactory results obtained with this receiver.

A large blueprint diagram covering the alterations suggested in this article may be obtained from the Radio department, Popular Mechanics Magazine, 200 E. Ontario st., Chicago. Send 15 cents to cover postage and packing. Specify blueprint No. 112.

Rear View of Condenser Showing Edgewise Plate Adjustment

Volume and tone control without changing your set in any way can be obtained with a new modulator plug. The device takes the place of the usual horn or phone plug and is slightly larger, with a small bakelite knob on one side. Turning the knob varies a graphite

Volume-Control Plug Connected to Horn Cord Ready for Plugging into Set

resistance in the plug base. With this adjustment, the operator can regulate the volume from a whisper upward, without touching any other control.

Paint on Radio Sets

On many homemade radio sets the baseboard is given an application of paint to better its appearance. But ordinary colored paint should never be used for this purpose, as it contains ingredients which allow a slight electrical leakage across the instruments, which are mounted on the baseboard. Only a good grade of oil stain should be used.

Condenser Operates on Spiral Cam

A variable condenser operating on a spiral cam, recently marketed, is claimed to separate uniformly over the entire 360 degrees on the dial, all broadcast wavelengths from 150 to 600 meters. The cam governs the relation of the movement of the plates to that of the dial. The insulated parts are out of the condenser field and resistance losses are claimed to be extremely small.

 A new receiver employing a tuning lever instead of the usual dials has appeared on the market. In general appearance the set

New Receiver, Showing
 Tuning Slot Which Takes
 Place of Usual Dials

is no different from the ordinary receiver except for the calibrated slot which takes the place of the dials. A tuning knob is moved along the slot to locate stations.

Preventing Surface Losses

It is of the utmost importance in radio broadcast reception that all parts of the receiver should work with greatest efficiency. The great difficulty in most sets is the inability to conserve the minute amount of energy collected by the aerial. When it is remembered that the very small amount of energy received by the antenna from the distant station, after going through the proper instruments, must emerge in such volume as to be heard in a large room, it will readily be seen that any losses between the aerial and the horn will affect good reception. Hence all parts, such as coils, transformers, condensers and wire joints, must have the least possible resistance, and insulation must be as perfect as we can make it in order to eliminate losses. It is characteristic of electricity that it will take short-cuts from wire to wire and to the ground. If any part of the receiver allows these high-frequency currents to wander from one part to another, sensitivity will be lessened, which in turn shortens reception

range, and adds other difficulties that cause the beginner much unnecessary worry. The panel, therefore, plays an important part in securing good results, and it should invariably be of the best insulating material possible, never of wood, as this will absorb moisture and is never entirely free from it. Many radio builders prefer a dull-finished panel to one having a glossy surface, as they think it looks better, but actual practice tends to show that the former is not as efficient as the glossy one. The practice of some radio builders to remove the glossy finish by roughening the surface with fine sandpaper, finishing with pumice stone and oil, is not to be recommended. The surface of a panel so treated resembles a series of minute hills and valleys. When the oil and pumice stone are applied, dust from the air is firmly fastened to the panel, and the oil collects more dust which quickly forms a high-resistance leakage path from terminal to terminal and from one instrument to another. Moisture, too, is more easily absorbed by the roughened surface and further aids the current to wander about. It is essential that both sides of the panel and subpanel be smooth. As an instance of wrong practice it may be worth while to mention the experience of a radio beginner who painted his radio panel to match the cabinet with the result that the range of his five-tube set was cut down to 65 miles with very poor reception at that, because the lead in the paint short-circuited the instruments.—W. S. Standiford, Youngstown, Ohio.

660

Detector Employs Tinsel Contact Brush

A crystal detector employing a contact brush consisting of forty silk cords, each wound with a flat bronze tinsel, has appeared on the market. The construction is clearly shown in the sectional view herewith. The adjustable spring insures the proper tension, the forty points of contact on the crystal improve reception, and the cushion of silk padding at the

base is said to pick up all "frequency energies" and prevent corrosion.

*Baker-Smith Co. d no
 New Call Bldg. P. M.*

Keep the Leads Short

All leads between instruments in a radio set must be kept as short as possible. When fastening the soldering lugs on the various instruments before wiring the receiver, set the lugs so that they point as nearly as possible in the direction in which the connecting wires are to run. This will not only make for neatness and convenience in wiring, but will also improve the reception, sometimes to an unbelievable degree. Not seldom, sets are seen in which the builder seems to have gone to a great deal of trouble to make the leads as long as possible. In some, the soldering lugs were both pointed in the opposite direction to that in which the wire should have run to get the shortest possible lead, and the wire, instead of running in a straight line from lug to lug, had been so bent that it was actually four times as long as it should have been. In an extreme case, the grid leads, which, by slightly rearranging the transformers and sockets, could have been kept down to $\frac{3}{4}$ in., were, when measured, $4\frac{1}{4}$ in. long, a considerable difference, and one that was apparent in the operation of the set.

Loop Aerial Combined with Loud Speaker

A loop aerial that can be combined with any loud speaker of the type shown in the illustration, is now available. This combination makes a practical, attractive and efficient unit in a very limited space. The wires are held in their proper relation by insulated spacers. To install the loop, the base of the horn is removed, and the loop clamped to base with two springs; the horn is then slipped between the latter. A sliding pivot at the top of the loop is adjusted to carry its weight at the proper height and directly over the base of the horn; the point of the pivoting rod is then pressed into the horn and the unit is ready for use. Compensating springs at the bottom make the loop fit the horn and permit it to revolve.

Above, Completed Coils on Cylinder; Below, Manner of Winding the Coils

Simple Variable Inductance for the Beginner

A simple variable inductance can be made at small cost from odds and ends around the average experimenter's workbench. A wooden cylinder, 2 in. in diameter and 12 in. long, is used both for winding and mounting the coils. One-fourth pound of No. 26 c.c. magnet wire will be sufficient for the coils. Close to one end of the cylinder, drive 13 nails into the cylinder at equidistant points around its circumference as shown in the lower illustration. This makes the form for winding the coils; wind the wire in and out around the nails so as to have a coil about 4 in. in diameter when completed. Dip the coil in melted paraffin, and when cool, remove the nails and slip off the coil. Make another coil in the same manner, and mount the two coils on the cylinder so that they can be moved toward or away from each other. Then connect them as shown; if good results are not obtained at first, reverse the connections between the coils. Support the cylinder on two small wood blocks, using brass wood screws to hold them in position. The proper inductance is gauged by the distance separating the two coils.—Stanley Radcliffe, Laurel, Md.

☞ Dry cells can be revived temporarily by punching holes in the base and soaking the battery in vinegar for 24 hours. This charge will not last long, but will answer in an emergency when new cells are not immediately available.

Richard J. Davis, dnc

**Indoor Aerial, Which Combines Wave Collector with
Condenser and Filter Effects**

Indoor Aerial of Unusual Design

A new and unusual type of aerial for indoor use has a center core of solid copper, over which a rubber insulation of high quality is placed, while the covering consists of braided tinned-copper wire. When this antenna is used in the form of a loop, the inner core acts as a magnetic return ground, designed to increase selectivity and tone quality; when used as a straight aerial the outside tinned-copper braid, because of its large surface area, is an ideal wave collector, the inner core acting as a magnetic-field ground. This dual-conductor construction has the effect of a condenser the full length of the aerial, and is claimed to be an ideal filter for grounding out or neutralizing noises, leaving the aerial to bring in the radio

waves without distortion. If used in the attic or around the room, it is unnecessary to use insulators.

Read the Article Too

One of the commonest faults of the home radio builder, making a set from a description published in a magazine, is that he "reads" only the pictures, drawings and list of materials. More often than not, the article itself contains information that is vital to the successful building or operation of the set, information that cannot be incorporated in the drawings, and, if the prospective builder skips the reading matter, he will wonder why his set does not work as expected. Another very common fault is substitution, either of materials or in methods of placing instruments and of wiring the set. Radio writers do not specify certain instruments because they prefer one or two particular makes, but because they have found that these work best in the set described. In another type of set, entirely different instruments may work best. In many sets, any condenser, transformer, coupler, etc., will work well, but, where the writer specifies a certain instrument, the builder should use it and no other. If he does not, he may not have any trouble, but the chances are that he will, and then he will blame the writer instead of himself. Don't be in too much of a hurry when building the set. It has been the experience of many radio editors, when a set will not work properly, and the reader swears that he has checked every wire, and that the set is "exactly according to specifications," that even a cursory examination will show one or two points where instructions have not been followed.

Horn Has Cylindrical Diaphragm

A loud speaker recently developed by one of the pioneer radio laboratories is distinguished by an almost cylindrical diaphragm.

The cylindrical vibrating surface is said to cause the sound waves to be distributed in a more natural manner than when projected in one direction, and give equal reproduction of all frequencies. The instrument can be used in either a horizontal or upright position.

Cylindrical Loud Speaker Can Be Used Either in an Upright or Horizontal Position

Mr. Forest Gladis P. T.

Iron in the Set

Don't use iron of any kind in the radio set. It may be in a place where it will do little or no harm, but ten to one, it will be the cause of several mysterious noises. One builder ran out of brass strip when building a superheterodyne, and decided that several small iron angles that he had on hand "would do well enough" for the contacts of the small 1½-volt flashlight cells used in the set. After the set was finished, he was troubled with a persistent hum, and, after checking and rechecking the circuit many times without discovering wherein he had made any error, he called in an expert. The latter was also puzzled for some time, but finally noticed, almost accidentally, that whenever a wire that ran directly beneath the iron angles was moved to one side and held there, the hum disappeared. Substituting brass for the iron cured the trouble immediately.

Compact Impedance Amplifier Unit

Compact audio-frequency amplifying units of the impedance-coupled type, recently put on the market, combine the choke coil with the gridleak and grid

condenser, greatly simplifying the wiring. It is installed in the set in the same manner as ordinary a. f. transformers and takes up very little space on the subpanel. Three stages are used instead of the

usual two a. f. transformers for practically the same volume. The tone, however, is claimed to be superior

New Detector Tube Uses Small Plate Current

A detector tube, recently developed by Mr. Harold P. Donle, is said to be sensitive to a degree hitherto unapproached by any other tube. The electrical characteristics are somewhat similar to those of the Sodian tube, and it can be operated without either potentiometer, gridleak or grid condenser. The plate impedance is very high. With 22 volts, the plate current is only .1 milliamp., the filament current being .25 amp. at 5 volts.

Tube Being Tested under Operating Conditions, Rheostat on Set Controlling Filament Supply

Instrument for Checking Radio Tubes under Operating Conditions

Checking tubes at home is a simple matter with the little instrument shown in the illustration. Each tube can be checked under identical conditions of actual operation. The tube is placed in the instrument, and the plug is put in the socket of the set. After making all connections, the condition of the tube is indicated by the milliammeter.

Soldering in Corners Aided by Wire Extension

A short length of busbar wire wound around the copper bit aids in soldering joints in awkward places. The radio builder, working with a man-size soldering iron, is frequently hard put to find a way of getting the point into some out-of-the-way corner of the set. The method of fastening the wire to the bit is clearly shown in the illustration; the projecting end should be long enough to reach the desired point, and sufficient heat will be transmitted through the wire to melt the solder and obtain a good joint.—A. C. Cole, Chicago.

Jewell Electrical Instrument Co. 1650 Walnut St Chicago

National Radio Cambridge Mass

268-Q

What's Wrong with Your Set?

By FLOYD GRAHAM

THE detector is the heart or mainspring of the radio receiver. It may be a crystal or a vacuum tube, but upon its efficiency depends the performance of the set. The purpose of the detector is to change the radio waves at the receiving set from high-frequency (above audibility) to audio-frequency so they can be heard. The necessary circuit for bringing about this change and delivering the audio frequencies to the headphones or loud speaker, where the electrical impulses are converted into mechanical sound waves, is called the detector circuit.

Many things can go wrong or be wrong from the first with the various units that make up this important part of any radio receiver. The tuning unit shown is a common one, used in receivers of the three-circuit type, and will do for illustrating the faults that may exist. We will first consider the winding; the turns may be shorted, due to solder droppings, or frayed insulation, and in this case the coil must be rewound. Enameled or d.s.c. wire is the best for this purpose. Weak signals are often caused by the connections to the tickler coil being reversed, for which the remedy is obvious. The aerial must be well insulated, to conserve the minute energy picked up from the transmitting station, so that losses will not occur between the aerial and the set. Cracked, or otherwise defective, insulators permit this feeble energy to leak to the ground through the accumulated dirt and moisture in these cracks. All aerial connections should be well soldered to insure a good electrical path; this also applies to the ground connections. If a water pipe is used, all paint and rust must be filed away before connecting the ground clamp. The ground clamps shown are of the approved type and insure

a good tight connection that does not require soldering.

Rheostats are units that are apt to go wrong; the terminal screws may work loose, or the sliding arm may make poor contact on the resistance wire. Tighten the screws and, if the sliding arm is loose, remove the rheostat and bend the arm so that it will make good contact when reassembled. Loose rheostat connections often cause the tube to flicker, resulting in weak and irregular signals. A vacuum-tube set

requires an A and B-battery, which must be effective, or good reception cannot be expected. If the filament battery is of the dry-cell type, the cells can be checked with an inexpensive ammeter; when the cells fall below 10 amp., they should be discarded. If a storage battery is used, it should be tested with a hydrometer, care being taken not to spill the electrolyte, as it is corrosive. The method of reading the hydrometer is clearly shown in the illustration.

The dry-cell or storage battery referred to is known as the A-battery and is used to light the filament of the tube. The B-battery usually consists of a number of dry cells connected in series, in one or more units, and the voltage is relatively high. Good volume and clear signals depend on the efficiency of this battery. The standard B-battery voltage for the detector tube ranges from 18 to 45 volts, depending on the tube used. These batteries are tested with a voltmeter in the manner shown, and, if found to have only two-thirds of the rated voltage, should be discarded.

Proper polarity of the phones and horn makes a great difference in the volume and quality of the signal. The phone cords

are usually marked for polarity; the positive cord tip being indicated with a red tracer cord and standard phone plugs are now marked for this positive connection. If not, trace the connections to the jack as shown. The positive B-battery connection should be on the frame of the jack. The frame makes the connection to the shaft of the plug, and the tip of the plug, separated by an insulator, as shown, makes the contact to the blade of the jack connected to the plate of the tube. The

vacuum tube must make a good contact in its socket; the prongs also must press firmly against the spring clips, and these points of contact must be kept clean. The tube prongs are tipped with solder, and a slight corrosion at these points will often give poor contact; a nail file can be used to brighten these contacts, but take care not to file any more than sufficient to brighten the points.

Careless wiring will produce poor results sooner or

later. If stranded insulated wire is used for the circuit, carefully remove the insulation at the point of contact, and twist the strands firmly together before soldering. Soldering lugs should be used under all terminals and the wire soldered to the lug. These lugs are made of tinned copper and come in a variety of shapes. If round tinned-copper busbar wire is used, and this is advised, a loop can be formed at the end of the wire, making a good mechanical contact before the solder is applied. Both the right and wrong way of making these connections are shown. Merely laying the wire on the terminal to be connected and applying the solder makes a very poor contact both mechanically and electrically. Poor in-

2975 Cottage Grove
Av. Chicago

insulating material in the socket will cause a surprising loss of efficiency. Examine the socket and, if it is of the cheap "mud" construction, discard it. The spring clips in many of the new sockets are of the type shown in the underview illustration. It will be noted that the clips make a firm contact with the sides of the tube prongs, offering a much greater contact surface. Some sockets are constructed so as to make both end and side contacts. See that the terminals on the socket are tight; it may be necessary to remove the knurled nut, and tighten the lower hexagon nut with a pair of pliers. Some of the newer sockets are provided with soldering clips instead of the knurled-nut terminals, in order to minimize loose connections.

The gridleak is a small but important part of the set, and must have the proper resistance for the detector tube used. It is a good idea to have several gridleaks of various values and try them in the set until the one that gives the best results is found. The grid condenser may be defective due to faulty design or careless soldering. Never apply a soldering iron directly to a condenser of this type, as the heat will destroy it. Soldering lugs should be fastened to the condenser by means of short brass machine screws and the leads soldered to these lugs.

Phones often become demagnetized by continually using them on reversed polarity, and are frequently damaged by dropping, as good phones are as delicate as a watch. In cases of this kind, it is best to return them to the manufacturer for repair. Keep the diaphragms free from rust and dirt; these thin disks must be in good condition or the quality and strength of the signals will suffer. The phone-cord terminals fastened to each unit must be kept tight, and the cord itself should not be allowed to become badly twisted. The delicate tinsel conductor is easily broken, resulting in crackling and popping noises in the phones. Renew the cords when they show signs of hard use. All these remarks, of course, apply also to the loud speaker.

Variable condensers are not the source of as many troubles now as they were in the past due to better design and construc-

tion, but loose bearings and dust accumulation between the plates will result in poor operation even with the best types. Keep them clean, and keep the bearings tight for best results.

775 A.F. Transformers Eliminate Unnecessary Wiring

A.F. Transformers with Sockets Mounted Directly on Them Make Connecting Leads Unnecessary

A.f. transformers and sockets, so designed that connecting leads are unnecessary, are now available. It is a well-known fact that short leads produce best results, eliminating feedback and preventing loss and distortion. Sharp tuning and tone quality depend on these factors. Units of this type simplify construction and add much to the appearance and efficiency of the

set. The compact assembly permits the builder to put his set in phonograph cabinets and other pieces of furniture with plenty of room to spare.

Microphonic Noises

One of the most common troubles in manufactured radio sets having ordinary sockets riveted to the subpanel, as well as many homemade sets, without shock-absorber sockets, is a loud, clear, ringing noise in the loud speaker, which starts softly and gradually increases in intensity until it is exceedingly annoying. This noise is caused by vibrations transmitted to the detector tube, and the best way to eliminate this trouble is to install a cushion-type socket for the detector tube. You will also find that one tube may be much more microphonic than another, so change tubes until you get a good one and then mark it. Microphonic noises are seldom caused by vibrating r.f. or a.f. tubes. Another temporary method of eliminating microphonic noise is to mount both the radio set and the loud speaker on sheets of sponge rubber.

See to it that the flare of the horn does not face the radio set directly as even the air vibrations caused by the loud speaker will affect the delicate detector tube. The loud speaker should not be set directly on the cabinet for the vibrations are easily transmitted in this way.—E. R. Haan, Chicago, Ill.

“Merry-Go-Twist” Gives Plenty of Thrills

By L. B. ROBBINS

TWIST it up; let it go, and there you are! How's that for fun? Three twists for a nickel. All aboard again, and let her go!

A “merry-go-twist” can be built by almost any practical-minded boy and will cost little more than a few hours' labor. All it requires is a long, wide plank, some piping and fittings and a heavy timber and rope, for the essential parts.

First clear away a space about 20 ft. in diameter with level ground between two trees. With the help

of someone, raise the heavy timber, which may be a piece of four-by-four or similar stock, and lash it to the trees about 10 ft. from the ground. If two limbs about the same height can be found on the trees, the

Here Is a Playground Thrill That Any Boy Can Make in His Spare Time, and That Provides Amusement for All Summer

timber can be lashed over them, but if not, lash it firmly to the trunks and spike a block of wood below the ends so it will not slide down out of level. Then get an old piece of $1\frac{1}{2}$ -in. pipe, about 12 ft. long, and a floor flange that will thread on one end. Dig a 2-ft. hole under the middle of the timber for the foot of the pipe.

The plank should be cut about 14 ft. long and may be 2 by 8 or 2 by 10 in.; either size will do. Bolt a short piece under the center to strengthen it, and then bore a hole large enough to slip easily over the pipe in the exact center of the plank.

Remove the legs from two old kitchen chairs and nail one seat to each end of the plank. Set the hole in the plank over the hole in the ground, place the foot of the pipe through the plank and let it rest in the hole below. Then push the flange under the overhead timber and fasten it in place with lag screws or bolts. Block up the plank about 2 ft. off the ground

and fasten a strong rope to a screw-eye bolted through the plank at each end of the strengthener. Twist each rope about the pipe once and tie the other end to the overhead timber at about the same angle as to the plank. It will be noticed that the chairs face in opposite directions on the plank. Twist the ropes so that, in untwisting, the chairs will be propelled front first. Then set the foot of the pipe by pouring cement in the hole and allow it to harden two or three days.

To operate the merry-go-twist, push the plank around a number of times until the ropes twist up tight on the pipe and will go no farther. Then let two passengers of equal weight climb into the seats and let go. As the ropes untwist from the pipe the speed will become greater and will not cease until the momentum of the plank winds them up several turns the opposite way. "Let the old cat die" before dismounting, and you will get all the fun there is out of it.

Convenient Towel Rack for Use on Hot-Water Heater

A handy and convenient rack for drying towels is shown in the illustration. A length of heavy wire is bent in the manner indicated to provide a series of hooks. The ends are clamped around the upright pipes on the boiler so that the hooks are suspended at a convenient height. When not in use this device is readily moved out of sight behind the boiler.

Doing Away with Cylinder Knock

There was a hammering noise in a Ford, sounding like a carbon knock, noticed when climbing hills and when pulling through sand or mud. The owner had the carbon cleaned out, and the knock disappeared for a time, but it soon started again as bad as before. He then took the cylinder head off, removed the carbon,

replaced the top with an extra cylinder-head gasket, and was never troubled with the noise since. The car also runs and pulls much better.—Glen F. Stillwell, Collinsville, Ill.

Smokers' Stand Made of Bamboo

For use on the screened porch a simple and neat smokers' stand can be made from a short length of bamboo fish rod, as shown in the accompanying illustration. The butt end of the pole is sawed lengthwise into quarters to the first joint, and the pieces are spread apart for the insertion of a heavy block of wood, which is fastened by means of small brads or screws. The upper section of the pole is similarly quartered down to the second joint, and the ends are spread and wired securely to a heavy wire hoop of a diameter suitable to support a small dish or ashtray. To add to the convenience of the stand, several screw-eyes may be driven into the post for holding pipes.—G. E. Hendrickson, Argyle, Wisconsin.

Folding Camp Kitchen

In this compact camp kitchen everything is in reach of the chef. When folded it is 19 in. deep, 30 in. high and 36 in. long, permitting it to be carried on the running board or in the rear compartment of an automobile. As shown in the drawing, the legs fold up under the table, which drops flat against the back of the cupboard. The covers of the stove compartment swing out to the side and form handy shelves. The cupboard may be partitioned and provided with shelves to suit the individual taste. A few hooks for dishcloths, pans, etc., will increase its convenience. The outfit is so simple that anyone can construct it easily with ordinary tools. All dimensions are based on the use of $\frac{1}{2}$ -in. lumber throughout. Hinges that fold flat should be used in all

Folding Camp-
ers' Kitchen,
Which Can Be Car-
ried on the Running Board

cases and folding parts provided with hooks to hold them in place when closed. A grab handle should be placed on each end of the cupboard to facilitate handling. The stove shelf, and all others, are set back $\frac{1}{2}$ in. from the front to allow the cupboard doors to close. The table legs are spaced so that they will lie edge to edge when folded inward, and the table is hinged to the back of the cupboard as shown in the enlarged detail.—Ronald B. Clifton, Denver, Colo.

Preserving Seed from Weevils

If seed beans or peas are kept in an old inner tube, they are safe from weevils. Be sure that the tube is dry, then pour the beans into the hole where the blow-out was, and put on a cold patch to make it air-tight. The tube may be hung, on a nail or a hook, in the barn.—Fred Cornelius, El Paso, Tex.

Wooden Rack on Ladder Rung Holds Shingles

Shingle Rack for a Ladder

When nailing a few shingles to the side of the house or edge of the roof where it is necessary to stand on a ladder to do the work, it is nearly impossible to hold the shingles and do the work at the same time. A rack holding two or three dozen shingles and attachable to the ladder on any rung will overcome this difficulty. Get two wide boards, slightly longer than the ladder is wide, and nail them together at right angles to form a trough. Then cut two cleats of hard pine or other hardwood, 2 or 3 in. longer than the width of the upright board. The cleats are shaped like hooks at the top so that they can be slipped over a rung, as shown in the detail. When a shingling job is to be done, fill the trough with

Rim Bolts Hold Extra Rims on the Carrier Securely

shingles, carry it up the ladder and hang it on the rung just over your head. The shingles will then be accessible and will not interfere with the work.—L. B. Robbins, Harwich, Mass.

Making Soldering Easier

The inexperienced man who attempts to do a little soldering generally overlooks the fact that the piece of work must be hot before a neat application of solder can be made. That is why it is difficult to solder heavy metal. If you use an electric soldering iron, heat it while it is lying on the article to be soldered if possible. If the solder does not stick to the work rub the iron back and forth across the spot to be soldered and then try again. It is impossible to weld two iron rods together by just heating one of them, and it is just as impossible to solder properly without heating the work. Avoid, if possible, clamping the work in a large vise, as this tends to chill the work, due to the absorption of heat by the vise. Cleaning the part is another necessary soldering operation and one that is just as important as the first-mentioned, for securing a good job. However, if the parts are small and you wish to tin them, get them hot and dip them in acid, then do the tinning. To tin a large area, heat it with a torch and then apply acid with a squirt can. This will clean it quickly and easily and make the tinning process simpler. Acid will eat a hole in a metal squirt can in time, but a battery hydrometer with the float removed will make a good substitute.—Glen F. Stillwell, Collinsville, Ill.

Simple and Effective Tire Carrier

Three standard rim bolts solve the problem of holding the extra spare tire that many Ford motorists like to carry with them on a long trip. The recent-model rims have fixed lugs. The accompanying photograph shows how the rim bolts through these lugs hold the spare rims together on the carrier.—Charles E. Miner, St. Louis, Mo.

❗ Never run a hacksaw too close to the vise jaws.

Beautifying Your Home Garden

By A. C. COLE

THE home owner who is able to use a few carpenters' tools can, at slight expense, add considerably to the appearance and value of his house. Few city or suburban lots are so small that there is no room for a simple rose arbor or trellis, a screen to hide an ugly alley view or to improve the appearance of the unattractive though useful garage, or a small pergola, even if it has no Corinthian columns leading to a long vista of formal garden. The examples shown in the accompanying illustrations are mostly very simple, and as before stated, need but little skill beyond the ability to handle hammer and saw, and occasionally a turning or keyhole saw.

The first thing is the selection of the lumber. The best all-around material for garden furniture of this type is cypress, or, if this is unobtainable locally, good yellow pine. It is sometimes hard to get cypress in "dimension" sizes, such as 4 by 4-in., and then yellow pine, which is generally available, can be used. Fir is also a good weathering wood, and one that takes paint well, and, where round posts are

built from standard sizes. Also, remember that lumber sizes are always the size of the rough lumber, before planing, so that a two-by-four is really not more than $1\frac{3}{4}$ by $3\frac{3}{4}$ in. in size.

All posts that are to be sunk in the ground, like the bearing posts of arbors, fences and pergolas, should either have their butts painted with liquid tar before being placed in position, or at least thoroughly painted with two or three coats of white-lead paint. A thorough soaking with creosote is also good to minimize rotting. Also, these posts should be sunk at least 3 ft. in the ground, or below the frost level, so that the heaving of the ground will not throw the whole structure out of plumb the first winter.

Another important thing is the fastenings of the structures. Use galvanized roofing nails or brass screws, which will not rust. Fastenings that rust not only

Fig. 3

needed for any purpose, these will usually be of cedar, which is likewise a suitable wood. Lattice is mostly of cypress, and comes in standard 1, $1\frac{1}{4}$, $1\frac{1}{2}$, 2 and $2\frac{1}{2}$ -in. widths.

Remember when ordering your lumber that this always comes in even lengths, beginning at 10 ft., then 12, 14, 16, 18 ft., and so on, so that if you order an 8-ft. board, it will have to be cut from a longer one and you will pay for the cutting and for the waste material. It pays to figure a little before ordering the lumber for any job, to see that the stock will cut without waste, or that it can be

CYPRESS WINDOW TRELLIS

Fig. 5

on centers each way. Still another, spanning a window, is shown in Fig. 3, and here the vertical strips should be carried down below the frost line, if they are allowed to go into the ground at all. However, they may be cut off about $\frac{1}{4}$ in. above the ground if desired, provided the trellis is well fastened to the wall, on 2 by 2-in. blocks, as specified.

TRELLIS FOR CORNER OF HOUSE

Fig. 7

mark the paint, but also allow the structure to fall apart after it has been up a year or two. When making joints in the wood work, slap a paintbrush full of white-lead paint on the joint before fastening the pieces together, to prevent moisture from creeping in and helping to rot the joints.

The simple wall ornament shown in Fig. 1 is made up from $\frac{1}{2}$ by $1\frac{1}{2}$ and 1 by $2\frac{1}{2}$ -in. cypress. The whole thing is assembled on the ground or in the home shop before erection, and then fastened to the wall with galvanized nails or brass screws, set into wood plugs, driven tightly into holes in the walls, if of brick. If the house is of frame construction, the wooden plugs are, of course, unnecessary, but 2 by 2-in. blocks should first be nailed to the wall, and the ornament fastened to the blocks. The important thing to observe in this, as in all lattice work, is to space the cross or lattice strips evenly. Unevenly spaced lattice work is apparent at once, and completely spoils the appearance of the finished work.

Another very simple trellis for the bottom of a low wall, or on which to train a small climber, is shown in Fig. 2. The strips here are $\frac{5}{8}$ by $2\frac{1}{2}$ -in., spaced 11 in.

An attractive design for an interior corner of a wall is shown in Fig. 4, and can be used either as a corner seat or as a stand for a flowerpot. Used either way, it makes a charming decoration. Full details are given in the illustration.

In Fig. 5 is shown an arch for the window, and here the amateur is likely to run up against his first hard job, in bending the arch strips. The strips can be bent, however, by steaming them for half an hour or so, or soaking them, where the bend is to be made, for the same time in hot water. Steaming is best. Failing the necessary apparatus for this, the strips can be bent by cutting as detailed in Fig. 6. First make a saw kerf in the piece, at the place where the arch springs, about as deep as it is thought the kerf should be. Measure from this a distance equal to the radius of the arch and make a mark on the strip. Now lay the strip down on the bench top, or on a level place on the sidewalk, and raise the end of the strip until the edges of the saw kerf meet. The distance from the radius mark on the strip

to the bench top, or sidewalk, will be the proper distance apart to make the saw kerfs. It will probably be found that cutting the kerfs half the thickness of the strip will be about right, but they must all be of uniform depth. The same method can be used for many other garden arches.

A trellis for the corner of the house is shown in

Fig. 9

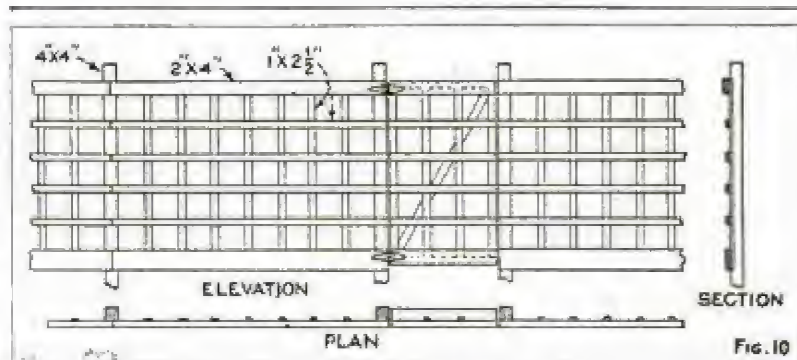

Fig. 10

Fig. 8

Fig. 11

Fig. 12

Fig. 7. The strips here again are $\frac{1}{2}$ by $2\frac{1}{2}$ in., fastened to the house as were the others.

To screen off an undesirable view, or to divide the flower garden from the vegetable garden, the attractive screen shown in Fig. 8 may be used. No over-all dimensions are given for this, as these depend on the loca-

Fig. 14

Fig. 13

tion. The spacing of the main members of the screen may be altered to suit the space at hand. This design may be modified in many ways; for instance, the triangular top work of the panels may be omitted, and the plain

Fig. 15

lattice work instead carried up to within a couple of inches of the top of the vertical columns. The vertical members are $\frac{3}{8}$ by 3 in., on each side of the lattice work, and they should be sunk in the ground at least 4 feet. On

all work of this kind, where the sections are of considerable size, the best job is done by setting the posts or vertical members in concrete. If this is undesirable, the soil must be packed solidly around them, and the structure should be temporarily braced to posts on the side until the fill has packed down hard and will support the structure solidly. This is especially necessary in the case of screens, as they, unlike arbors and trellis arbors, have no side support.

Leaving the back yard for the moment, Fig. 9 shows how the arch trellis can be applied to the front of the house. The benches can be made of pine or fir, and the whole makes a very attractive entrance for the cottage or the colonial type of small house.

Three simple and attractive fences for the garden are shown in Figs. 10 and 12. Here the important things to remember are to keep the posts exactly in line, and to place them such a distance apart that the stock selected will cut without waste and still come evenly on the centers of the

Fig. 16

Fig. 17

posts. The best way to erect the fence is to set up the end posts first, plumbing them until they are exactly perpendicular and then stretch a line between them. Set the intermediate posts to the line and plumb them, and the fence will be right. This applies to posts for pergolas and long arbors also.

Fig. 13 shows a very attractive combination garden entrance and seat, but the same design, without the seat or gate, can be used in any part of the garden. The design can also be adapted for use as a pergola. I have not shown any pergolas using round columns, as these are rather expensive, and, in any event, if the reader wants a pergola of this type, he can easily get a design from the catalogs of houses supplying this material.

So much of this work depends on individual taste that only a few of the designs shown are fully dimensioned. The other sketches accompanying this article contain suggestions that will enable the owner to work out his own sizes and details. In general, the amateur will be well advised to stick to designs employing straight lines, and to avoid curves as much as possible. The ends of rafters of pergolas and arbors, etc., can be ornamented in several very simple ways as illustrated in the various drawings, with no more tools than a compass or keyhole saw and a brace and expansion bit.

Care of the Iodine Bottle

Using iodine as a first-aid application in cases of slight injuries has long been advocated. Every home shop should have a small quantity easily accessible so that even the smallest cut or scratch will not be neglected. The usual history of the iodine bottle is one of mishaps. When first bought, it is used and then placed on a shelf. Next it is tipped over a few times, which allows the iodine to devour the cork in a short time. Before long the cork does not seal the bottle but merely sits on top of it. This permits evaporation of the lighter parts of the liquid, and finally there is no longer a tincture but a thickened mass not fit for use. To overcome these conditions it has been found satisfactory in one large garage, to suspend the iodine bottle from a nail in the wall of the washroom by a short cord. It is always in one place and easily reached. It is not necessary to take the bottle down to use it. The cord allows it to be tipped. By hanging it up in this way the bottle cannot be upset and the cork will not be wetted with iodine.—Sherwood J. Gee, Montpelier, Idaho.

Ladder for Telephone Linemen

A telephone company provided its linemen with ladders that can be placed against curved or irregular surfaces of poles and trees without danger of slipping. The arrangement is simple enough; it consists of nothing more

than a length of chain, that is substituted for the top rung of the ladder. The chain is

attached to the stringers with eyebolts and a little slack is allowed so that it straddles the pole.

❗ Do not apply furniture polish to soiled furniture, or it will never look bright; wring a cloth out of soapy water, and wipe the furniture carefully, then polish.

Removing Ground Rods

A ground rod, when driven into solid earth to a depth of 6 or 8 ft., usually resists any attempt to remove it by ordinary

Simple Way of Removing Iron Ground Rods

means. This trouble may be

overcome with the aid of a crowbar and a trace chain. One end of the chain is fastened to the bar and a running loop on the ring end is slipped over the end of the ground rod. With the point of the bar resting on a solid support a foot or more above the ground, the rod is quickly started and removed by raising and lowering the bar a few times.—E. L. Goodwin, Warren, N. H.

Catching Drill Chips

When installing certain types of gas savers on the car, it is necessary to drill small holes in the manifold pipe. Care should be taken to see that none of the drill chips enter the pipe, for they might be drawn into the engine and lodge under a valve, causing serious trouble. Use of a stiff cup grease on the drill will hold the chips very well and keep them from getting into the engine. Through the entire drilling operation, the drill should be coated with grease in case the drill should penetrate faster than expected. But, if possible, this should be wiped off and a fresh coating applied just before the drill goes through the metal. It is well to cool the drill by dipping it in cold water before applying the final coating. After drilling, cup grease is used on the tap also. Magnetizing both the drill and the tap will add safety to the operation.

Fly Trap Made of Paper Is Efficient

The paper fly trap shown here is efficient, easy to con-

Cheap Paper Fly Trap Proves Effective and Can Be Burned after Use

struct, inexpensive and may be burned after it is filled with flies. It consists of a cone made of heavy wrapping paper. A small hole is left in the pointed end. The cone is trimmed even at the base and doorways provided as shown. A tab, coated with sirup to attract the flies, is glued about halfway between the top and bottom on the inside, and glue is brushed around the outside on a line a short distance below the tab. A paper bag of suitable size is placed over the cone and its opening pressed against the ring of glue, to hold it in place. It is obvious that the flies, attracted by the sirup, will enter the doorways, pass through the small end of the cone and are then unable to escape.

Kinks for the Auto Tourist

If you are in doubt about which road to take while touring let the telephone wires be your guide. Telephone wires lead to the cities and towns, and the tourist need have no fear of going wrong if he follows the road having the most wires. If you wish to light a camp fire and discover that you have no matches, disconnect a spark-plug wire at the plug, saturate the end of a stick or cloth with gasoline and hold it between the spark plug and the end of the wire so that the spark will light the gasoline. A good place to carry spare grease is in the rear hub caps.

Most light cars have no need for grease at this point, but it is a convenient place to carry it on those long drives when every bit of space counts. You do not always need to use the extra fan belt or light bulbs, but when you need them they are worth many times their cost; so be sure to have an extra one with you. Do not carry suitcases, etc., between the hood and the front fenders on a new car, as the varnish will soon be worn off by rubbing against the baggage, but secure them to the running boards. Don't forget to include a couple of wooden blocks or boards in the camping equipment, as they come in handy if you get into a mud hole. If your lights suddenly flare up and go out, do not install new ones until you have looked over all connections to the battery, making sure that they are tight; then do not install the lights with the motor running, for the generator may have burnt out the lights owing to a loose connection. You will generally find this loose connection at the battery terminals. Make sure of this by trying your starter. If it does not work, your battery connections are loose. If it does work, examine the connections at the junction block, ammeter or switch. Don't take it for granted that the battery connections are tight but tighten them as much as possible with a wrench or pair of pliers. Pay particular attention to the ground connections.

Mowing Heavy Grass

When lawnmowers are crowded to cut thick and heavy growths of grass, the

stationary cutting bar and supporting roller frequently jump or "buck," leaving unsightly patches of long grass here and there about the lawn. By attaching the spring-and-roller device shown in the drawing, this

trouble is readily overcome. The main leaf from a discarded wagon-seat spring

Convenient Hoist for Raising Rowboats and Canoes Is Attached to the Dock and Can Easily Be Operated by One Man

is bolted to the underside of the mower handle so that the two small wood disks, or wheels, mounted on the free end of the spring, will rest upon the wood roller of the mower when the handle is pressed down. In ordinary use, the spring plays no part, but when the mower is driven into rank grass, the handle may be held low enough to bring the rollers in contact, thus holding the rear part of the mower against "bucking."

Matches Save Ferns

If your potted ferns seem to wilt and die from no apparent cause, it is likely that they are being attacked by small worms that feed on the roots. A good remedy for this trouble is to bury a number of sulphur matches in the soil about the roots as shown in the illustration. The moisture will disintegrate the sulphur in the matches and this will kill or drive off the worms effectively.—C. M. Wilcox, Torrington, Connecticut.

Novel Boat Hoist

Where a great many boats or canoes are kept a boat hoist of the kind shown in the drawing will prove very useful. The hoist is made of 4 by 4-in. lumber and consists of a cradle, which is submerged so that the boat can be driven over it, and a lever, which extends vertically from the cradle and is pulled down to raise the cradle above the surface of the water. To permit this, the hoist must be pivoted on the edge of the dock as indicated. The pivot is a $\frac{3}{4}$ or $\frac{5}{8}$ -in. iron rod extending through the frame and also through two 4 by 4-in. blocks, securely bolted to the dock. A rope is attached to the top of the lever so that it can readily be pulled down. A large screw eye is driven into the dock for fastening the rope.

☞ A paste for cleaning greasy and inky hands can be made by pulverizing a cake of scouring soap and mixing it with a cup of hot lard. Stir well, and when it is partly cool, pour into a container. This is an ideal soap for printers, blacksmiths and auto mechanics.

Shading the Sand Pile

In many backyards there is no tree shade, and if there is a sand pile for the youngsters, they must play in the sun

Sunshade over Sand Pile Protects the Children from the Heat

most of the time. The photo shows a small sand pile, confined within a frame 4 ft. wide and 6 ft. long, with a muslin-covered roof. The roof comes to within a foot of the ground at the ends and the center is $4\frac{1}{2}$ ft. high. After the muslin was sewed together and tacked in place, light strips of wood were nailed down over the edges to prevent it from being torn off.

Making a Drop Rudder

There is nothing like a drop rudder for a sailing canoe or rowboat, and although it may seem difficult to rival a manufactured job, it is an easy matter to make one at much less cost that will answer the purpose just as well. The material used is galvanized sheet iron; stock of $\frac{1}{16}$ -in. thickness is heavy enough for the biggest boat on which such a rudder is likely to be used. The exact dimensions, shape and weight of the material depend, of course, on the size and model of the boat. The blade is cut to the shape indicated, making sure that it is per-

fectly straight, and the edges are then smoothed off nicely. The rudder post is a length of $\frac{1}{4}$ -in. flat steel, about $1\frac{1}{2}$ in. wide. To the lower part of this post a wing piece is riveted as indicated, a $\frac{1}{2}$ -in. hole being drilled through it in the center of the round end, and the blade riveted between the wings so that it can move up and down rather stiffly. The application of a little heavy oil or graphite grease will make it work with sufficient freedom without becoming too loose. The rivet may be a short piece of $\frac{1}{2}$ -in. steel rod or a short $\frac{1}{2}$ -in. bolt. A hole is also drilled in the blade to receive the rivet and it should be enlarged to about $\frac{3}{4}$ in. in diameter, and a brass or iron washer, a trifle thicker than the blade, is filed down to a force fit in this hole and reamed out to fit on the rivet. To limit the downward swing of the blade a length of furnace chain is attached to the top and to the rudder post. To mount the rudder, the stern and rudder posts are fitted with eyes of flat steel, placed as indicated, so that the rudder cannot move up or down on the rod by which the assembly is held together. Removal of this rod allows the rudder to be taken off and lifted into the boat when desired. The steering gear may consist either of a simple yoke of strap iron riveted to the rudder post and moved by tiller ropes, or a double yoke, connected by chains and moved by a sliding tiller, the latter arrangement being more "shipshape." If the boat has a curved stern, the rudder post should be

Detachable Drop Rudder for Sail and Rowboats

curved to correspond, except that part to which the wing piece is attached, and the locking rod must, of course, also be curved. The lower rudder and stern post must then be attached immediately above the wing piece.—Howard Greene, Washington, D. C.

☛An old-type auto sidelight makes a good lamp for backing up at night. Placing it in the center of the tire support will be found to be about the most convenient location.

How You Can Make a Wiggling Pup

By B. VAN BUREN

ANIMATED wooden toys on wheels are very popular, and are much enjoyed by children. The construction of the wiggling pup is simple and will prove an interesting pastime; the youngsters also will like it so much the better because some one of their own family made it. The feature of the toy is its jointed body,

board, or the tail will be easily broken off when it receives the more or less rough handling a child is certain to give it. Then, with a fretsaw, cut out the outline very carefully. After each section is cut out, round off the corners at the joints, drill holes through them as indicated and sandpaper the surface until it is smooth

Simple Design for a Toy Pup Made of Wood and Having Flexible Joints; the Work of Assembling and Painting It Can Easily Be Done in an Hour

which causes it to dart from side to side as it is pulled along on the floor.

Any close-grained wood can be used, such as poplar or white pine. A piece of $1\frac{1}{4}$ -in. stock, 6 in. wide and 15 in. long, is all the wood required to make it. First lay out the pattern on a piece of paper of that size, laid out in 1-in. squares, using the design in the accompanying illustration. Then get some carbon paper and trace the design on the wood after this has been well planed. Take care that the grain of the wood runs lengthwise of the

and ready for the application of paint or enamel. The axles can be made of the same stock; they are about $\frac{3}{4}$ in. square and 5 in. long. They are screwed to the feet, holes being drilled first to prevent splitting the wood. Almost any kind of wheels can be used and they are fastened to the axles with wood screws or nails, leaving them loose enough to turn easily. If one has access to a wood-turning lathe, neat wheels of the same thickness as that of the body of the pup can be turned out. A small hole is drilled through the center

of the front axle for a string to pull the toy with. Get the joints to work smoothly before applying paint or enamel. By using a file on the flat surface and then

Details of Wiggling Pup, Showing Pivoted Joints and Felt Ears

rubbing a little vaseline or hard oil on them, they will work very smoothly.

The natural color of the dog, which represents a dachshund, is black or brown. Glossy enamel will be found most effective on toys, and three coats of colored lacquer will give a good finish. However, if paint is handy, it can be used, and then a glossy finish can be had by applying a coat of varnish. Black for the axles and a bright red for the wheels will be pleasing to children. The wheels should, of course, be finished separately, and when they are put on the axle, an iron washer should be used to reduce friction between the wheel and the axle. The ears can be cut out of a piece of brown or black felt and are glued or tacked on. Nails are used for pivots on which the joints move and are cut off so that they will not project under the body. It is a good idea to counterbore the pivot holes at the top to take the nail heads.

Lubricating Keys

should be used for this purpose. I recently met three men who were in the

It is not a new thing to use graphite for lubricating the key in a lock to eliminate the grind of the metal surfaces against each other, but many believe that only powdered graphite

locksmith business, trying to lubricate a Yale-lock key with lubricating oil. When corrected and told to use a leadpencil for lubricating purposes in such instances, they were surprised that they had not thought of that before. There are many times when thin keys stick in the lock and give trouble, and a leadpencil stroked over the surfaces of the key will often eliminate the trouble.—Harry E. Gifford, Medford, Mass.

Testing Butter

If in doubt whether you are getting genuine butter or oleomargarine, you can settle the question by the following test: A level spoonful of the substance is held above a gas flame, and if the contents shows a sort of foam when heated it is real butter. Otherwise, the cow had no part in its manufacture.

Charger Connection for Ford

For a portable battery charger, a contact can be attached to the generator wire under the hood on a Ford car, the generator wire being used instead of the battery wire, because it is at the end of the terminal block and also because the charging rate will be shown on the ammeter of the car. The charger can be connected by simply raising the hood and attaching the positive clip to the generator wire and the negative clip to the cylinder-head screw, or some such part. This is much more convenient than

raising the floorboards or the turtle back and connecting the charger directly to the battery. An upper point from a discarded Ford coil can be attached to the screw on the terminal block of the generator to extend beyond the end of the terminal block to facilitate attachment of the wire. If the car has a wooden dash, a wood screw and a short piece of tubing can be used to steady the upper end of the coil point. On a metal dash, use a piece of insulating material cut from a dash terminal block and fastened

to the dash with two small screws. Part of the lower edge of the coil point should be filed away to clear the upper edge of the terminal block and allow the ear on the point to come down far enough for the terminal-block screw to be replaced.

Cleaning Burnt Cooking Utensils

The black crust formed on the bottom of cooking pots and sauce pans by burning can readily be removed by first placing the vessel upon the stove and allowing it to heat thoroughly. Then cover the bottom with vinegar and add a teaspoonful of soda. Let it boil for several minutes, then empty the vinegar and remove the softened crust with a scraper.

Novel Garden Hoes

Some years ago a friend of mine had several hoes made of the kind shown in the drawing. They are especially useful while the plants are still very small. With this type of hoe you can work right up to the plants without any risk of injuring them, as the manner of attaching the blade to the handle with an open fork enables you to see just how far the hoe is cutting. This is almost impossible with the ordinary tool, especially when hoeing around small plants.—H. H. Siegel, Emporia, Kans.

Homemade Tray for Storage Battery

When placed upon the floor or table, storage batteries often cause acid stains of a more or less serious nature. This trouble can be prevented as follows: Obtain a shallow cardboard box, somewhat larger than the battery, and give the interior a liberal coating of rubber cement. When dry, this will provide an acid-proof and non-leaking receptacle for the battery.

Non-Slip Diving Board

The slippery surface of a wet diving board is often the cause of injury to swimmers, so the manager of a lake resort devised a very simple and practical method for making the boards at his beach slip-proof. A number of rubber bands, about 2 in. wide, were cut from discarded inner tubes and snapped over the board, spaced about 1 in. apart. This provides enough friction to prevent the divers from slipping.—G. E. Hendrickson, Argyle, Wis.

Effective Crow and Hawk Trap

For trapping crows and hawks the method shown in the illustration has been found successful. In an open meadow twelve stakes

are driven into the ground and left projecting about 1 ft.; they are spaced 4 in. apart. A small stake is driven into the ground in the center of this pen and a small chick is tied to the stake as a decoy. The sides and top are covered with light baling wires run back and forth to form a 4-in. mesh. A number of steel traps are then set outside of the pen. When the crow or hawk pounces down upon the chick the wire mesh throws it off, usually landing it with its claws in one of the traps, and it is impossible for it to get at the chick even if it isn't caught. This method has been used with great success.—Hugo Glitzke, Tonganoxie, Kans.

Changing the Ice-Cream Freezer for Motor Drive

Those who have had the experience of turning an ice-cream freezer occasionally,

that since nature supplied the chick with raw egg as its first food the delicate digestive organs of the young bird should be better able to assimilate this than a cooked egg. To overcome the difficulty in feeding, the raw eggs were whipped with about an equal part of wheat bran. It is claimed that the chicks consumed the mixture eagerly and made gains in weight and growth far in

Homemade Electric Ice-Cream Freezer Mounted on Truck Saves Much Time and Work; Details of Driving Gear and Clutch That Takes Place of Hand Crank

will appreciate the usefulness of the motor-driven outfit shown in the drawing. Both freezer and motor are mounted on a wooden truck, provided with casters so that it can be conveniently rolled around. A frame is built at one end to support the driving gear. The freezer itself is of the hand-crank type, but is adapted to the motor by removing the crank and substituting a wooden flange to which a worm gear is fastened, and a small belt is run from the motor to the worm gear to drive it. A $\frac{1}{2}$ or $\frac{3}{4}$ -hp. motor is strong enough to turn a 6-qt. freezer. A sheet-metal cover should be made, to shield the motor from water and ice. In use, the freezer is filled in the usual way and the truck then wheeled to a position near a wall socket so that the extension cord can be attached. In less than 30 minutes the ice cream will be ready to serve.—Mrs. H. T. Hixon, Auburn, Ala.

Raw Eggs for Baby Chicks

In experimenting with the feeding of baby chicks a Wisconsin poultryman has found that the common practice of feeding them hard-boiled eggs for the first week or so does not bring about the results in growth and development that are obtained when the eggs are fed in a raw state. The tests were made on the theory

excess of those fed in the regular manner.—G. E. Hendrickson, Argyle, Wis.

Hose Attachment Sweeps Leaves from Lawn

Although built from scraps of wood, the hose attachment illustrated is very efficient in removing leaves from a lawn, as the stream of water is easily directed over the surface. Laid back on the handle, the device is also useful as a sprinkler. Cut a handle, about 3 ft. long, of 1 by 2-

in. stock, and nail to one end an 8-in. length, which is braced at right angles to the handle by a strip nailed diagonally on each side. A thin strip tacked across these braces completes the device. In use, slip the hose nozzle under the cross strip until it lies at the bottom of the angle, as indicated.

How to Repair a Slit Tube

When an inner tube bursts, the result is often a slit a few inches in length, which, if repaired with a patch on the outside in the ordinary manner, is likely to extend beyond the ends of the patch after a little more running. The tube may be repaired in a satisfactory manner, however, in the following way: At each end of the slit, cut a small round hole, and turn the inside edges of the slit out so that they can be cleaned. Then insert and cement a patch on the inside of the tube, and cement the usual patch on the outside.

A tube with a $4\frac{1}{2}$ -in. slit was repaired in this manner, and has since run over 600 miles without any sign of trouble developing.

Inserting Electric Plugs

In many homes electric appliances are attached to sockets having glass shades, which must be removed before the plug can be screwed in, as the hand is too large to enter the glass shade. Most plugs are separable, one part being threaded and the other part having two prongs, which are inserted in slots in the first part. To eliminate the necessity of removing the shade, I attached two short strips of sheet brass to the end of a short round stick, placed the threaded part of the plug on the prongs and screwed it in place. After this is done, the part of the plug having prongs can be pushed into place without difficulty.

—Harry E. Gifford, Medford, Mass.

Killing Flies

One objectionable feature of a fly trap is the killing of the flies with hot water. Fasten a can to the inside of the trap, fill it with water, and hang a sheet of poison fly paper over the edge of the can, one end of the paper in the water. The flies are sure to drink from the moist paper as there is no other source when they become thirsty. The dead flies are readily dumped out without the inconvenience of first killing them.—Gordon H. Sears, Salt Lake City, Utah.

Spring Aids in Driving Tacks

In making fly screens and screening in a porch my fingers were quickly bruised in starting the tacks, so I conceived the idea shown in the illustration. I first took a strip of tin to try the scheme and after finding it successful, I made a permanent one out of an old corset stay. A notch was filed in the latter and a hole punched at the other end, through which the spring was tacked to the hammer handle, as shown. The spring is turned to one side after starting large tacks or small nails for driving but for small tacks it is left on the face of the hammer. If a hammer having two faces is used, it can be reversed for driving.—G. M. Beerbower, Tarrytown, N. Y.

Noisy Jaw Clutch

There is a type of coupling used on many automobile engines for the purpose of driving the pump, generator or magneto, which is known as a straight-jaw clutch or Oldham coupling. After considerable wear, play occurs between the two halves of the coupling, and this play usually adds to the many noises which develop in an engine. From a discarded inner tube, cut a strip of rubber, long enough to wrap around the junction in the coupling twice and about 2 in. wide. Place two hose clamps side by side around the rubber and set the nuts tight on the clamping bolts. On some engines where the coupling is badly worn, it is suggested to remove it and to slip a piece of hose onto the shaft ends, holding it in place with hose clamps and letting the drive go through the hose.

Hanging Electric Fixtures

By E. R. Haan

FIXTURE hanging is the task that remains for the home electrician after he has completed the wiring, as described in the May and June, 1926, issues of Popular Mechanics Magazine. For the living and dining rooms, library, halls, etc., more or less elaborate fixtures will add much to the appearance of the home, while ordinary drop cords with keyless sockets are sufficient in bedrooms, and key or pull-chain sockets in closets. Most fixtures consisting of more than a rosette, cord and socket, have an iron crowfoot, which is first screwed to the ceiling, the screws projecting into the fixture-support board previously nailed between the joists, as shown in Fig. 2. The ends of the fixture cords are bared and are pushed through the tapped hole of the crowfoot so that connection can be made with the outlet leads. The latter are twisted around the fixture cords, which makes the connection strong mechanically. Then the connections are soldered and taped. A good wrapping of tape is essential, as the sharp ends of the wire might puncture a layer of tape, and in case the wires of both connections should touch the metal bell of the fixture, a short circuit would result. The short length of pipe is then screwed into the crowfoot, and the bell is pushed up against the ceiling and fastened there by tightening the setscrew, as shown in Fig. 1. In some cases it is necessary to reduce the length of the chain on fixtures so that they will hang at the right height. This is done by taking two pairs of pliers and opening the links which are to be removed, as shown in Fig. 13. By doing it as indicated in the insert, the links can be opened without marring them.

The installation of flush switches is shown in Fig. 3. The rubber-covered leads are pulled out of the box and the switch is fastened in place. The wires are then bared, up to the screw to which they are to be attached, and are twisted around it under the head, which is then driven down tight. There is a correct and incorrect method of twisting wire under screw-heads, as shown in Fig. 12. The wire should always be wound around the screw in the same direction as the threads. If it

is wound around the screw in the opposite direction it will tend to loosen. Two types of flush switches are shown in Figs. 4 and 5, the latter being of the key type, which makes it impossible for anyone to meddle with it. A snap switch with an extra porcelain base is shown in Fig. 6, the base being used only in exposed wiring, such as in basements and barns. As direct outlets for lamps, washing machines, electric irons, etc., the flush plugs shown in Figs. 7 and 8 are used. When wiring these, be sure that the wires do not touch the metal switch box, or there will be a short circuit. After the plug has been connected, the plate is screwed on.

When making drop cords, use a porcelain ceiling receptacle of the separable type shown in Fig. 9. The base is first

screwed to the ceiling and connected. A length of lampcord is connected to the other part of the rosette and a socket is attached to the other end of the lampcord. Knots of the kind shown in the detail prevent strain on the screws to which the bared ends of the lampcord are connected, so that short circuits will not occur, and generally make the cord more durable. For exposed wiring, the ceiling receptacle shown in Fig. 11 will be found convenient. If you have a direct outlet with a key socket and wish to change it to a ceiling fixture, a pendant switch on a length of lampcord, as shown in Fig. 14, should be used unless a wall switch is desired, in which case some additional wiring has to be done, as explained thoroughly in preceding articles.

Novel and Easily Made Signs That Attract Trade without Being Objectionable

Novel Signs Attract Business

Signs of the type shown in the illustration are often unobjectionable on highways where other kinds of signs would be thrown out by order of the police. The pigs shown in upper photo, which announce the approach to a barbecue stand, are cut from heavy tin and painted black. The first pig, from either approach, announces "Pig Stand No. 1" is just ahead. A herd of a dozen tin pigs are spread twelve feet apart before the stand. Each pig has a different message to tell. One tells of a hamburger, another of barbecued meats and a third announces soft beverages.

The pigs are life-size with the realistic curly tail up over the back. It is a unique form of telling the public what the merchant has to sell, and the very novelty pleased rather than raised objections, such as some signs would provoke if placed along the parkway.

Pictures from a magazine, traced on tin and cut in silhouette, and letters cut from advertisements and pasted on a board, served to make another neat sign for a country tea garden just a few miles outside of Kansas City. The picture was from an advertisement setting forth the refreshing qualities of a certain well-known soft drink. Cut in tin and mounted on a stout baseboard, which was bolted to an angle and then mounted on a post, the sign was artistic and attractive. The picture sets

forth emphatically the main item the merchant has to sell. The letters pasted on a plain oak board, give the name of the stand. The post set in the ground is solid and in harmony with the entire layout. —C. N. Cook, Kansas City, Kans.

Shoe Scraper for Car

Farmers and others who are forced to walk to and from their cars in heavy mud will find that a scraper fitted under the running board is a great convenience. An effective scraper can easily be made from a strip of 1 by $\frac{1}{8}$ -in. steel, bent and drilled to form a U-shaped stirrup, and then screwed to the underside of the running board. If desired, the scraper may be fitted with round-head bolts and wing-nuts so that it may be detached whenever it is not needed. The depth of the "U" should be such, of course, that the shoe can easily be inserted and drawn back. If only one is fitted, it should be on the driver's side, but one can be fitted on each side if desired.

Oiling Auto Springs

By drilling a $\frac{1}{4}$ -in. hole through the floorboards on either side of his car at the point indicated in the drawing, an auto owner provided an easy means of oiling the rear springs. He found, however, that

dirt soon clogged the holes, causing the oil to seep along the underside of the floor and over the outside of the apron, which accumulated dust and presented a dirty appearance. This trouble he remedied by inserting a short length of brass tubing, flared out at the top, in

each hole. The tube extended about $\frac{1}{2}$ in. below the running-board shield and was bent to come directly above the spring shackles. Short nails were used to plug the holes between oilings. —R. C. Tarr, Gloucester, Mass.

Drain Box for Overshoes

When not in use, rubbers and overshoes can be kept in a box having a grating half-way down and a water-tight tray in the bottom. The rubbers are placed in the box, and the water, mud or snow drains off into the tray. The tray can be taken out and emptied whenever necessary. The grating is best made of galvanized material to prevent rusting. The box should be large enough to hold one pair of rubbers for each person in the building and, perhaps, a few extra pairs belonging to visitors.—E. T. Gunderson, Jr., Humboldt, Iowa.

Fencing the Haystack

Stacks of hay and straw are frequently left in the fields during the rush of the season's work to remain until the farmer can take time for their removal to the barns or feed lot. As the live stock is usually pastured in these fields, it is necessary to protect the stacks by means of improvised fences. To accomplish this in the quickest manner possible and also eliminate the troublesome task of driving posts around the stack, a Wisconsin farmer has employed the novel method shown in the drawing. A number of sharpened stakes, 10 ft. long, are connected in pairs by bolting them together at the center as illustrated. When the stack is completed, these scissor-shaped braces are opened to an angle of about 25° and the sharp ends

Scissor-Shaped Braces Supporting a Barbed-Wire Fence around the Haystack

inserted horizontally into the stack at 10-ft. intervals and about 3 ft. above the ground. By stapling a strand or two of barbed wire to the projecting ends of the stakes, the fence is completed and prevents molestation by the live stock.

Using Rubber Floor Mat as Water Carrier for Filling Radiator

Emergency Filler for Radiator

When one is in the country and discovers that the radiator has to be filled with water, but is handicapped by not having a pail or similar receptacle, the rubber floor mat will be found quite serviceable. By folding it, as shown in the detail, and holding the edges together firmly water can easily be carried in it and poured through the radiator opening.—Joseph A. Moffitt, Phoenix, Ariz.

Raising Flagpoles

When raising a long flagpole or radio mast, a stepladder or other short ladder can be used as a prop. The base of the pole is placed over a hole dug for it as usual, and the other end of the pole is lifted. When the men who do the lifting have raised the pole as high as they can reach, the ladder is placed under it, allowing the lifters to move on and take a new hold where the pole is not so high. The ladder serves the same purpose as the props with forked ends used by linemen when erecting telephone poles, but these are not available to most people. A stepladder is bet-

ter than an ordinary ladder for such heavy loads as its top step is stronger than the top rung of the other type.

☛ Bread crumbs rubbed over a drawing remove the dirt but not the pencil lines.

Shallow Pan on Running Board of Auto Carries Ice without the Need of Tying It

Carrying Ice in Auto

An autoist who lived some distance from the route of the ice man found it necessary to get his own supply of ice. Not wishing to put it inside of the car, he made a shallow pan of galvanized iron, about 12 in. wide, 24 in. long and $\frac{1}{2}$ in. deep. The corners were soldered to prevent the pan from leaking. In use, it is attached to the running board of the car with two small C-clamps, obtainable at any hardware store. To hold the cake of ice in the pan securely and prevent it from sliding off while traveling or hitting the side of the car, a few roofing nails such as are used to fasten asphalt shingles were pounded through small pieces of galvanized iron and then soldered to the bottom of the pan so that the points projected upward.—R. C. Tarr, Gloucester, Mass.

Removing Insulation from Wires on Grinding Wheel

A grinding wheel can be used to remove the insulation from cotton-covered magnet wire by simply pulling it lightly across the face of the wheel. This cuts through the insulation on one side and

the rest falls off. If the wheel is run slowly little damage will be done to the copper wire and no harm to the wheel. Most kinds of wire can be bared by this method, but there are some that will gum and fill the wheel, for instance, rubber-covered wire. The wire should be held in both hands if possible and drawn straight across the face of the wheel.—E. T. Gunderson, Humboldt, Iowa.

Easy Way of Pitting Cherries

One day, when it was necessary to can cherries immediately owing to other duties, and a cherry pitter was not available, I wondered how I was to pit them. I did not wish to crush them by pressing out the pits with the fingers, so I looked around the kitchen and found a wire from an ice-cream box. With this I pitted the cherries with the greatest ease and in a very short time without crushing them.—Miss C. Roskoten, Chicago, Ill.

Preventing Food from Burning

Practically all cooks, at times, place a plate in the bottom of a cooking pot to prevent puddings or other food from burning. Very often the hot fire drives the water from under the plate, which then becomes too hot and the food is at least scorched. To prevent this

trouble, take a tin pie plate, put it over a piece of

wood and with a nail and hammer punch a number of holes in the plate, from the inside. This leaves all the roughness of the punched holes on the underside, which is placed on the bottom of the pan. There will be no danger of scorching or burning

when this plate is used, because it is impossible to force all the water out on account of the numerous holes. There are factory-made articles used for this purpose, but a tin plate with punched holes as described is just as good.—James E. Noble, Toronto, Can.

All Shop Notes published in 1925, in book form—Fifty Cents—from our Book Department

Sharpening Your Own Saws

By EDWIN M. LOVE

*73 W. Valmeyer Ave
Arcadia, Calif*

THE teeth of a saw are miniature chisels, designed either with square points to cut parallel to the grain of the wood, as in a rip saw, or with beveled teeth to shear across the fibers, as in a crosscut saw. The large teeth of a coarse saw, receiving greater individual pressure, bite deeper than the smaller points of a fine saw, generally cutting faster and, incidentally, rougher. However, a coarse saw

cut it, and the more play given the blade. Fatigue and play both make for inaccuracy, to say nothing of lessening production. Do not blame the saw for pinching before knowing whether or not the binding is due to sagging of the board being cut, or closing of the kerf because of internal strains in the material. Rub the blade often with an oil pad, and in ripping, wedge open the kerf behind the saw.

is used for rough work not so much for its greater speed as for the ease with which it can be sharpened. Many carpenters, and most amateurs, put too much set in their saw teeth. The wider the saw kerf, the more power required to

Some authorities advise the amateur to practice saw filing on an old saw, presumably one that has already been practiced on and cannot be made any worse. This is poor advice for the man who really

is offset. Do not make the mistake of bending out the beveled side, for then the saw will not cut at all. Hold the set always at the same angle, so as to give equal deflection to the teeth. This is

important, since teeth which project more than their neighbors, do most of the cutting and

wants to get skill in filing a saw. It taxes the ability of an expert to straighten up a bungled saw. The best practice is on a saw fresh from the hardware store,

since it has teeth of even length, pitch and spacing. A new saw is never quite pointed up, but requires a light going over. At any rate, start on a saw that has been well filed, and reasonable progress can be made.

Sight along the teeth (Fig. 1) to see if they are fairly regular in length. They should appear as a straight, or slightly crowned line of "V's." Clamp the saw in a vise, and, using either a regular saw jointer (Fig. 3), or a mill file held flat (Fig. 4), take one or two light cuts full length of the blade. Sight the points again, and if there are any kinks or local curves, joint down the high points. The rule is to file lightly and sight often. When the points are reduced to a smooth line, examine carefully to see that all teeth have been touched. Each should show a tiny triangle of bright metal at the tip.

A saw does not need setting every time it is filed. If it is taper-ground, it will run in dry woods with almost no set. Adjust the anvil of a saw set (Fig. 2), rest the stops on the teeth, and grip each tooth just enough to bend it without crushing (Fig. 5). Only the upper half of the tooth

scratch the work besides making the saw run out of

For general filing, the slim taper file is good, though for fine saws the extra-

slim taper is still better. A small file makes a smoother cut than a large one, and having sharper corners, gives a little more depth to the tooth and more sawdust clearance. Six-inch files are the shortest useful length, and they must be wide enough to project considerably above the points of the teeth. Drive the file tang solidly into a handle, to prevent turning, for a correct pitch cannot be maintained throughout the job if the file can twist.

To file a crosscut saw, clamp it solidly with the jaws about $\frac{1}{2}$ in. below the teeth, at the tip of the blade. With the file pointing toward the toe at an angle of about 45° and upward about 20° (Fig. 6), make a light stroke with the pressure against the forward or cutting edge of the first far tooth, using the back of the near tooth as a guide, and cutting the latter as little as possible. A light stroke is essential with a new file, for a heavy cut may chip the corner, spoiling it for further use. Never use a dull file, since it not only cuts slowly, but irregularly as well. A dull corner means a shallow gullet and chattering of the file on the rounded bot-

tom, with almost certain misshaping of the teeth. A good file may sharpen two or three saws; but these tools vary so much in hardness and toughness that it is not unusual to wear out one or more files on one saw.

The teeth and the spaces between them are 60° angles if filed straight across. Filing at an angle, however, makes them less acute. The natural result is that if the filing angle with the length is increased, some cutting on the back of the near tooth is inevitable, while if the angle is decreased, a certain play results that makes variation of pitch from tooth to tooth more likely. If regularity of this angle is kept, the pitch will therefore be more certain.

Up to a certain point, the more nearly the front of the tooth approaches the vertical, the faster the saw cuts, and generally, the rougher. The filer must make a choice between speed and quality. On fine saws the cutting edge of a tooth may be safely pitched at 25° or even 20° with the vertical, while with coarse saws the pitch may be still steeper.

If the saw is not very dull, one or two strokes to each tooth may be enough. File until the bright blunted triangle on the point all but disappears, and then go to

the next tooth on that side. When for any purpose the file is removed from the work, keep the grip on the handle unrelaxed, and the correct pitch angle can be more easily duplicated on the next tooth. To repeat, this constancy of filing angle is most important.

Having filed one side, reverse the saw and do the teeth on the other side (Fig. 7). The file still points to the toe of the saw, but the position of the body and arms is quite different from the first. Take care to use the same angle as for the other side, or the teeth will be of different size. File on the cutting edge of the tooth until the bright tip disappears entirely, since there is no danger of cuts being taken from the back. Stop the instant a point is obtained.

Having finished the saw, examine it carefully for underfiled teeth. It is surprising how many dull teeth may be found after filing is supposedly completed. Carefully touch these up.

Most teeth now have clinging to the cutting edges burrs which should be removed by laying the saw flat on a fine oilstone (Fig. 8) and drawing it across, once for each side, or reversing the process by laying the saw on a flat surface and

moving the stone over it. Sight down the teeth, and if the filing has been well done, the tips will show a smooth trough, in which a needle can slide full length without falling off. Give a further test by

three years, and himself for several years. A change to the above-described method, however, seemed to bring slightly better results, although it must be admitted the improvement may be imaginary. To the

sawing a wide board or cutting through a 4 by 4-in. or heavier stick (Fig. 9). Once started, the saw should follow the line almost automatically, cutting smoothly and quickly. If the

teeth on one side are long, the saw will be deflected toward that side because of the faster removal of waste there. For the same reason, if the teeth on one side are duller than on the other, the saw will "run" toward the sharp side. It is for this reason that it is so important to get absolute uniformity in the teeth.

A rip saw is jointed and set in the same way as a crosscut, but all the filing is done from one side, taking all teeth in their turn. Use a large enough file, hold it level, and file nearly square across, making the fronts of the teeth vertical, or nearly so. Most authorities advise filing square across; but it will be found an advantage to give a slight bevel by pointing the file a little left or right, as the case may be. This does not injure the ripping qualities, and greatly facilitates cutting through knots.

Because the reader is sure to find a carpenter who files his saws against the cutting edge, rather than with it, a comment about this style of filing is in order. It has one very strong argument in its favor, namely, that no feather edge is turned up. This reason was sufficient to induce the writer's grandfather to use it during his lifetime, his father until within the last

best of the writer's knowledge, all manufacturers recommend filing on the far tooth, and a reference to the diagram (Fig.

12) illustrates certain differences in the shape of the tooth obtained, which may or may not prove the superiority of far-tooth filing to the other.

Whichever method is used, the filer generally has the point of the file higher than the tang. This establishes a fundamental difference in the resulting teeth. With the far tooth, the gullet slopes down away from the cutting edge, while, in the other case, it slopes up from the cutting edge. With any given number of points per inch, therefore, a longer cutting edge is obtained when filing against the tooth. It might seem that this is an advantage, giving greater sawdust space and a longer shearing cut per tooth, but it must be remembered that, because of setting, the point does nearly all of the cutting, so that the total length is not so important. It will be noticed, moreover, that with the accepted method of filing on the far tooth, the back of the tooth has considerably less bevel than in the other case, the point itself is less acute in the thickness, and the tooth is correspondingly stronger, less likely to break when struck against a nail, and more resistant to wear.

Avoid freak tooth forms. Once in a while a carpenter is found who pitches his

cutoff-saw teeth like rip-saw teeth, but gives them the customary bevel. There is nothing to be gained by this. If a great deal of angular cutting is to be done, such as mitering sheathing, or cutting wall braces and floor-joist bridging, this style of tooth is excellent, and it is worth while to keep on hand for such work a saw filed so, but it is a poor tool for general work.

Whenever possible, avoid setting a back-saw, although a small amount of set is almost necessary for a miter-box saw. Do not pitch the tooth more than 25° with the vertical. Well sharpened, the saw should cut so smoothly that, to use a block plane afterward, would roughen the cut.

Compass saws and their variations may be filed as a compromise between rip and cut-off teeth, since they rip as much as crosscut.

Few people know that a coping saw can be filed. As a matter of fact, even a new blade is dull and can be improved by filing. Put it in a coping-saw frame and clamp it in a vise. Then file almost square across, with the file held level, taking each tooth in turn and giving a little bevel according to the set (Fig. 11).

By all means preserve the polish of a saw. Rusty spots mean binding, and the attendant evils of buckling and kinking. If the blade has been exposed to rain, rub it dry immediately, and oil it. Rain water, though considered soft, really contains some nitric and carbonic acid, discouragingly efficient as a rust producer. Beware of it. When tools are near the seashore, take special precautions to prevent the salt air from corroding them. Keep saws out of the vicinity of dynamos and other electrical machinery, for once they are magnetized, the filings cling to the teeth, making sharpening difficult. Tighten the handle screws occasionally (Fig. 10), since true cutting cannot be done with a slack blade, and once in a while also give the handle a polish with linseed oil on a clean rag, finishing it with a dry one.

Hinged Manger Can Be Easily Cleaned

Lighting Manholes

Trouble-shooting trucks of a western gas and electric company are provided with a reel, holding a 30-ft. extension cord

Special Six-Volt Lamp on Extension Cord for Lighting Manholes

and a special lamp, which is operated on a 6-volt storage battery. This equipment is used for lighting the interior of manholes that are not fitted for plugging in with the city-lighting system.—Charles W. Geiger, San Francisco, Calif.

Easily Cleaned Feed Box

Feed boxes in horse mangers are usually permanently fastened to prevent their being overturned, and so become catchalls for chaff, dust, corn-cobs and similar refuse, that is apt to mold sooner or later and endanger the health of the horses. A Wisconsin farmer devised a self-locking hinged box which may be dropped down on the side of the manger, allowing all trash to be thrown out of the feed box. When the box is put back in place again, the latch drops down without any attention and locks the box. The latch is a 1 by 4-in. board, about 2 ft. long, bolted to the center of the door and suspended like a pendulum against the back of the manger, as shown in the drawing. When necessary to turn it over for cleaning, the latch is raised to a horizontal position, and the box is swung over.

Improving the Combined Harvester and Thresher

In western Kansas there is a farmer who does not spend all of his hours in doing manual labor, but still farms broad fields and hires little help. The photo shows one of his methods of solving the hired-help problem. It formerly required two men to operate his combined harvester-thresher,

for the connecting link shown. The bar B is drilled and provided with a setscrew for holding the cutting tool, while the other bar is clamped in the right-hand head and wedged to hold it solidly. A machinists' jack is placed back of the bar B to prevent it from rising on the return stroke of the planer table. The swivel bolts in the head holding the cutting tool are eased up so

Combined Harvester-Thresher Changed So That All Adjusting Levers Are Located on the Rear of the Tractor, Which Permits One Man to Operate Both the Tractor and the Combination Machine

one to drive the tractor and the other to operate the adjusting levers. Removing the front trucks from the combination and mounting the adjusting levers on the rear of the tractor permitted one man to take care of both. Some of the levers had to be changed to make them set forward instead of backward. This gave a short-coupled outfit, much lighter than before the change. With it a worker can cut 160 acres of wheat yielding 6,500 bu., in 5½ days, and with one man to haul the threshed grain from the field, he placed the crop in the bin at about ¾ cent per bushel.

Radial Cutting on Planer

Radial cuts on the planer are the exception rather than the rule for a machine primarily designed to form plane surfaces. However, by means of a simple arrangement curved work is easily produced. The bars A and B are the only extra parts required for the rig, and a hole is drilled in one end of each

that the cutter can be pulled around in an arc when fed over by the feed box. The tool-holding head is clamped tightly to the cross rail. Set the tool bar to cut the required radius and start the cut, feeding the tool as desired.—R. W. Laing, Kirkhall, Canada.

Hints for the Draftsman

Rub magnesia carbonate on vellum before beginning a drawing. This will permit complete erasure of all pencil lines

and the drawing will remain much cleaner. It can be purchased in the form of a cake. Rub the cake over the vellum, then work it in thoroughly with a cloth. It seems to fill up the pores and harden and improve the surface in every way. The transparency of vellum is a great advantage for it can be

placed over other drawings and the work can be traced. Moreover, prints can be made directly from a pencil drawing on it. The disadvantages are the great difficulty of erasing and the tendency to become soiled, and the

Radial Cuts on Planer Are Easily Made by This Set-Up

kink mentioned above eliminates both. To prevent the T-square from soiling the drawing as it slides up and down, put a string over the drawing and fasten the two ends together under the board with a rubber band and a hook made from a paper clip. Two or more strings should be used, on which the T-square slides. The rubber bands keep the strings tight and can be shifted to avoid the triangles.

To prevent your pencils from rolling, cut a piece of eraser, about $\frac{1}{2}$ in. square and $\frac{1}{4}$ in. thick; make a hole in the middle and slip it over the end of the pencil. The hole can be made by using the tin eraser holder on the end of an ordinary pencil as a drill.

Adjustable Jack for Repair Work

Screw jacks, ratchet jacks and hydraulic jacks are normally used in repair work on heavy machinery, to support parts when disconnected. A simple idea for a jack is shown in the drawing. The base is a pipe flange of large diameter. The body consists of a pipe screwed into the flange, with the upper end beveled. The jack bar is made of cold-rolled steel or any

smooth iron bar. The upper end of the bar is fitted with a flange to provide a wide bearing area. The latch is simply a large heavy washer, fitting freely on the bar with several hundredths of an inch clearance. The washer in the

tion grips and locks the bar against downward movement.

Use of Gypsum Weakens Cement

Where gypsum and cement are mixed together and subjected to moisture the gypsum deteriorates or "rots," and the cement will be weakened considerably. Gypsum plaster on a cement wall, which becomes damp or wet, will also rot within a short time. Therefore, gypsum should never be used in cement.—L. E. Gulker, Rainier, Oreg.

Wall Paper Display Rack Made of Window-Shade Rollers

Display Rack for Wall Paper

A good display rack for wall paper can be made to hold a number of rolls by using common window-shade rollers, cut to the desired length and fixed in a frame with the regular brackets, as shown, so that the pattern will be uppermost when the paper is pulled out.—L. E. Brundage, Norwood, Colo.

Hanging Windows

Hanging windows so that they can be quickly opened and closed, can be done as shown in the drawing without the use of boxing. Light iron channels, placed along each side of the opening, provide grooves in which pins fitted into the ends of the lower sash slide. The upper sash is hinged to the top of the window casing and the bottom sash is hinged to the upper one in the manner indicated. Upward movement of the lower sash raises the upper one, and when completely opened, both sash will extend at nearly right angles to the opening. Counterbalancing should be provided or the window operated by rope and pulley.—A. C. Cole, Chicago, Ill.

Gang Slotting Fillister-Head Screws

We had a large number of fillister-head screws to slot and had been putting them one by one in a vise to do it, but found this method too slow. The work

Fixture Which Makes It Possible to Slot Twelve Fillister-Head Screws at Once

was accomplished much more quickly in a milling machine, the table of which was operated by means of a hand lever. We made a cast-iron block, drilled 12 holes in it, and slotted a space for a brass bar on either side to hold the screws securely when tightened by means of a wedge, which was slipped into slotted endpieces as shown. With this fixture we were able to slot twelve screws just as quickly as one could be slotted in the vise. The holes for the screws were made slightly oversize to provide clearance.—J. H. Moore, Montreal, Canada.

Difficult Fitting Made Easy

One of the most difficult jobs in carpentry is scribing both ends of a board to fit it between two irregular surfaces. The upper detail of the illustration shows a

Fig. 2

placed at the right of the opening and scribed, which is indicated by the irregu-

lar line at the right. The template is then shifted to the left position and scribed, which is indicated by the irregular line shown to the left. The distance of the back of the niche must be transferred to the uncut stool, giving allowance at each end for the lugs. Place the template in such a position that the lines can be marked accurately. If the back is also irregular, a second template is made, on which the back line is scribed, and then transferred to the uncut stool. In such a case the back must be marked first.

Starting the Knurling Tool

From personal observation I have learned that many mechanics have great difficulty in getting a knurling tool properly started. The common straight knurled surface is, of course, very easily made, as the knurling tool has only one roller, but the trouble is when the novice attempts to use the double knurling tool, which has one roller milled with a right-hand spiral and the other with a left-hand spiral. The two rollers are generally set one above the other, and when properly applied to a job, make a knurled surface with a diamond pattern. The rollers must be in exact relation to each other when they revolve against the work, otherwise a surface is made that much resembles the teeth design of a crosscut file. In order to get the rollers properly timed with each other, I found it best not to apply the full width of the roller to the work in the beginning. After the knurling tool has been properly set at right angles with

Fig. 1

Fig. 2

the job, it should be fed against the end so that only one half of the roller surface comes in contact with the work, as is shown in Fig. 1. By applying good pressure using the cross-feed screw, the rollers will time themselves properly and a true diamond-shape knurl will be formed by letting the tool feed along the work.—Chas. Homewood, Ontario, Calif.

Ⓢ Don't drive a key into place unless you have some means of getting it out again.

A Hammered-Copper Letter Box

The common purchased letter box is not a very attractive thing, yet, without paying a considerable sum, the home owner is usually unable to obtain anything

This can often be obtained from an old tank, since the surface of the copper plates is to be hammered in any event, and small dents in the sheet from which it is made will not be any drawback. The amateur will have little difficulty in cutting the soft sheet to the outlines given with the shears. A sharp chisel should be used to cut out the interior parts of the design, supporting the copper sheets on a metal block. It is not necessary that the edges be exactly even, although they should not be left ragged.

After the sheets are cut, place them on a piece of hardwood, and go all over the surface lightly with the ball-peen end

A. Homemade Hammered-Copper Letter Box That Can Be Made into an Attractive and Profitable Side Line by the Neighborhood Mechanic

better-looking from the stores. The usual way out of the difficulty is to paint the box the same color as the trim of the house, and thus make it as inconspicuous as possible, but even this does not entirely satisfy the owner. The letter box shown in the accompanying illustration is not only pleasing in design but simple enough for the handy man to make himself. If a few of the boxes are made up as samples, a neighborhood mechanic should have little difficulty in disposing of them to the owners in his vicinity, and there is good opportunity to build up a side line that should prove remunerative.

The house number may be made a part of the box in the manner suggested in the drawing. If the number is one of four figures, these, of course, must be made smaller, and the number arranged on the box front diagonally. The rivets used in the assembly of the box may be omitted, if desired, and the entire box soldered, but the rivet heads add greatly to the "spirit" and attractiveness of the design, and it is recommended that the riveted construction be used. Sheet copper, $\frac{1}{16}$ in. thick, is the material used.

of a machinists' hammer, in order to make the indentations on the surface that give the box its antique look. Do not try to have all the hammer marks exactly alike in depth, but do not vary them too much. The hinges and hasp should be of copper rather heavier than that of the body, and copper rod, $\frac{1}{8}$ in. in diameter, used for the hinge pins. Fasten the box to the house with large copper ship nails, if these can readily be obtained. If not, use round-head brass screws, and slightly mar the heads, after driving the screws home, with the hammer.—G. A. Luers, Washington, District of Columbia.

Leave the oven of your gas stove slightly open for a few minutes after the burners are lighted, to prevent rust.

Wooden Flues Help Ventilation

To help the ventilation of a town hall in a small Oklahoma town, a number of wooden ventilators of the kind

shown in the photo were made for the windows on the south side of the building. The hood extends down about 6 in. below the top of the window, and is built up of 1 by 6-in. boards to the width of the window, converging to a square flue, 6 in. square and about 5 ft. high. As the bottom of the hood is closed all the air that goes up the flue must come out of

the hall, and when the upper sash is opened the warm air is quickly drawn out. It is claimed that air was drawn out at least three times as fast with these flues when installed as when the windows simply were opened at the top.—Dale R. Van Horn, Walton, Nebr.

Baling Scrap Sheet Metal

What do you do with your scrap sheet steel? We used to put it in a pile or in a large box and then haul it out back of the plant. But scrap sheet metal handled in this way was of no value to us. We even had to pay to have the pile removed. This work was a miserable job, taking days and resulting in many cuts on the hands. So we built a baler to remedy the trouble. The frame was made of $\frac{1}{8}$ by 1 by 1-in. angle iron, inclosed with No. 20-gauge sheet steel. To provide a convenient size of bale, both in weight and dimensions, we made the box 20 by 38 by 18 in. Two recesses along the side allow insertion of two baling wires, which are put in the baler before the scrap. The time saved in the process of baling easily offsets the time taken to cut long narrow strips into lengths that will enter the baler. Some man who is not busy all the time can be appointed to do the baling. We now have a clean floor space around our

shears and never have to worry about moving our scrap-steel pile. The dimensions of the baler, of course, can be altered to suit plant conditions and equipment.—W. E. Gunnerson, Milton, Wis.

Drive Fit on Pins

When a pin is to be secured in a chuck wrench, or a dowel is to be made a drive fit, many mechanics flatten it slightly with a hammer or make a series of prick-punch marks around it. This makes a poor job that usually does not last long. It is much better to lay the pin in a V-block and make from one to three cold-chisel marks around it parallel to the axis. The ridges thus made keep their holding power, no matter how deep the pin may be driven and also prevent it from turning. The best method of all is to knurl the pin, but often a lathe is not available, and the above method is then the next best.—John A. Blaker, West Auburn, Mass.

Removing Cable Lugs from Car Battery

With only a pair of pliers and a wrench it often takes 15 or 20 minutes to remove a storage battery from a car, but with the aid of the handy tool illustrated, it takes only a

few seconds. The construction and use of the tool are clearly indicated. It consists of three pieces, a handle, a plunger and a fork, the last two being pivoted on the handle. In use the fork is placed under the lug of the cable and

the plunger on the battery terminal. Pressure on the handle then pulls the lug off the terminal. This is a simple tool, and the time spent in making it will be repaid many times by the ease and rapidity with which it does the work.

Ⓒ Draftsmen should remember that a little note of explanation in the corner of a drawing often helps the worker.

A Corner Workshop for Apartments

By A. C. LESCARBOURA

THE handy man who is bent on pursuing his hobby in the narrow confines of a small apartment must resort to no end of makeshifts. First of all, he must find space enough to do his work, and, in the modern birdcage kitchen, that may be no simple problem. His work completed, he must find storage space for his equipment, and that also gives the amateur mechanic furiously to think. The solution is generally in the form of an improvisation, more or less successful, generally less, although many projects of the handy man have been worked out successfully on the kitchen sink, as the radio fan knows.

The "board workshop" shown in the accompanying illustrations will help solve the problem for those who have not as yet

arrived at any satisfactory answer. The foundation of this is a plain board, about 2 by 8 in., although the size of the board can be suited to individual preference. This is held down to the kitchen table by means of two clamps, made from flat steel or iron, as shown in the detail drawing. One of the clamps serves only to hold the board to the table; the other, in addition to holding down the board, may be set and

The Apartment Mechanic Need Not Worry Where He Is Going to Work If He Makes This Simple Board

clamped to the latter at any point along its length, and aids in holding boards to be

planed or otherwise worked, as shown in the upper photo of the larger illustration. The drawing shows the construction of this clamp clearly enough to make further description unnecessary.

While any kind of vise that the maker desires can be used at the end of the

Details of the Movable Clamp for the Board and the Easily Made Vise

board, the one shown is particularly suited to the job, as the rear jaw moves instead of the front one, and it thus becomes a work clamp when used in connection with the movable flat-steel clamp. Thus, when planing a length of wood, or gluing boards together, the vise is closed, the wood placed behind the rear jaw, and the movable clamp slid along the board to the other end of the work, whereupon it is tightened.

Now, by opening the jaws of the vise, the work will be held firmly. The vise is set in a slot cut in the end of the board, and the various parts are not at all hard to make. The jaws may be castings, but the home mechanic will probably find it easier to cut them out of machine steel using the same material for the plates on which the screw block runs. The screw may be one taken from a cheap vise, or one may be made in the local machine shop at small cost.

With this workshop, there is no danger of marring the kitchen table, and the owner can work to his heart's content. It will be found advisable to place small blocks under the points of the clamp screws, below the edge of the table. Quite a lot of good work can be done with this simple outfit.

Repairing Ford Battery Carrier

Ford battery carriers often cause trouble due to loosening of the four rivets, which hold the wide band underneath. This allows the battery and band to swing from side to side with the motion of the car. In some cases the battery will drop so much that the clamps will no longer keep it in place. This will even occur when the fastening bolts are tight and the carrier is well bolted to the frame. A remedy is to remove the battery from the carrier and the carrier from the car, cut off the four rivets with a cold chisel on the outside of the carrier, and drive them out. Then holes are bored with a $\frac{5}{16}$ -in. drill for carriage bolts of this size, which are placed with the heads on the inside of the carrier. These holes should be countersunk or squared on the inside of the band to fit the squared part of the bolt. Use $\frac{5}{16}$ by $1\frac{1}{4}$ -in. bolts, such as those clamping the flat-iron bands about oval or round Ford gasoline tanks. These are somewhat too long, but are best suited for the purpose, as they have a shorter squared part and a flatter head than ordinary carriage bolts. Lock washers should be used under the nuts. The bolts can be tightened from under the car when necessary.—E. T. Gunderson, Jr., Humboldt, Iowa.

Homemade Hinge or Butt Gauge

An accurate and efficient hinge or butt gauge used for hanging doors can be made as follows: Take a block of hardwood, preferably maple and about 4 in. long, $1\frac{1}{2}$ in. wide and $1\frac{1}{8}$ in. thick. Into the face of the block drive a small screw, file the edge of the head so that it will cut well and set the screw to the distance that the hinge is to go back on the door. The gauge can be adjusted

to any depth by simply turning the screw in or out. Now, into the side of the block drive another screw, sharpening it in the same manner and turning the screw in so that the cutting edge is the same distance away from the block that you desire the hinges to let into the door and jamb. Now turn the block up on its edge. On one of the outside edges and about halfway of the length of the block drill a hole the same size as the

head of the screw you are going to use for a cutter, so that only about three-fourths of the hole is in the block. Turn the screw into the hole and you will see that you have a cutter made by the head of the screw sticking out past the face of the block. This gives you the gauge that marks the distance that the hinge is to be set into the door jamb from the door stop. You never use this gauge endways as you have to use the regular metal gauges, thus there is no wobble or variation. It is very light and can be easily carried in the pocket. It can be made by anyone in a few minutes and will last indefinitely, as there is nothing to rust except the screws, which can readily be replaced.—C. E. Gardner, Herndon, Va.

Drawing Guide for Window Letterer

A simple and useful device for a window letterer, which promotes accuracy and speed, is a guide rail supported by two rubber suction cups. It is used in place of the ordinary maul, or padded stick, which most letterers hold in the left hand, with one end against the glass and the forepart of the right arm against the stick. The guide shown is about 36 in. long, hav-

ing a straight edge so that it can be used as a ruler. At either end is fastened an ordinary rubber suction cup such as is used on electric massaging devices. It is provided with a threaded metal inset by which it can be fastened to the end of the stick. This guide can be

placed in any desired position on glass or wooden surfaces and will provide a firm support for the hand.—Hoag & Ford, Los Angeles, Calif.

RUBBER SUCTION CUP

provide a firm support for the hand.—Hoag & Ford, Los Angeles, Calif.

¶To keep the mother hen from scratching and wasting chick feed, cover a piece of 1 by 12 by 24-in. board with $\frac{1}{2}$ or 1-in. mesh poultry wire by tacking it to the edge; then nail a strip of lath to the edge to form a shallow box. This will stop the waste of expensive chick feeds.

Air Blower for Curing Hay Independent of Weather.

There is always an element of uncertainty in depending on favorable weather conditions when the hay is to be cured.

Curing Newly Cut Grass Artificially Gives Good Quality and Uniformity to the Hay

The illustration shows a method of curing it by means of an air blower that is always dependable, and the quality of hay is generally much better and more uniform than if it is left to dry on the ground before stacking. A length of pipe is led from the fan or blower, just underneath the surface or on the ground, to the center of the spot where the stack is to be made. The end of the pipe is fitted with an elbow, the opening turning upward. An ordinary metal washtub is perforated with a number of $\frac{1}{2}$ to 1-in. holes through the sides and bottom and turned over the end of the air pipe as shown. The hay is piled in a medium-size stack over the tube and the blower started. By this means air will be driven through all the hay and a sweet, mellow roughage will result.—L. M. Jordan, Vredenburgh, Ala.

Safety Link in Tow Chain

When plowing with a tractor it is always advisable to use a weak link in the drawbar chain so that it will give when a large stone is struck. It can be made by using a piece of rod iron and bending it to the shape of an "S," as shown in the illustration.—W. R. Smith, Cloverdale, Can.

Disappearing Air Hose

Whenever an air-hose nozzle is used within a limited radius, a disappearing holder such as that shown in the drawing will automatically

Convenient Holder for Air Hose in Woodworking Plant Disappears When Not in Use

hold the nozzle and hose out of the way when not required. It is often quite dangerous to leave a hose lying around a machine, and, aside from this, it is a nuisance to have to continually move it away or hang it up. To make the holder, a length of 3-in. tube, a tee and floor plate are assembled in some convenient place, preferably against the wall or a post. Before assembly, the tee is drilled through on both sides. On one side a pin is driven in and the hose wrapped around it one turn. The other side has a loose pin, headed over at each end to keep it in place, and carrying a pulley made from a shaft collar with a washer on each side. A weight is made out of a piece of flat iron doubled over and drilled through at the open end for a pin carrying another shaft collar, which acts as a roller. The operation of the holder is obvious. When the hose is re-

quired the nozzle is pulled out, causing the weight to rise. When the nozzle is released the exposed hose disappears inside of the tube leaving the nozzle only outside. This is made certain without injury to the parts by arranging that the weight strikes the floor just before the nozzle reaches the tee. Care should be taken not to use a weight that is unnecessarily heavy but one that counterbalances.—Harry Moore, Montreal, Can.

Polishing Radius of Screw-Machine Form Tools

To polish a radius in a form tool, get it free from scratches and keep the radius true has always been one of my most difficult jobs. I now do it to perfection by turning a piece of brass to the proper diameter and using it for a lap. After the radius has been cut in with a tool and filed fairly smooth, the tool is run slowly in the lathe, while the lap, driven rapidly in an electric drill chuck, is held in the groove to be polished. The lap should be fed generously with valve-grinding compound, grade D. Grade A is used for finishing. It will be necessary to use several laps as they wear down rapidly. As there are two rotary motions at the same time, a radius is generated to perfection, which is impossible by any other method.—John A. Blaker, West Auburn, Mass.

Cleaning Sewers

Sewers, which are not completely plugged can be cleaned as shown in the accompanying drawing. A wooden ball, slightly smaller in diameter than the inside of the pipe is placed in the sewer at the first manhole above the section to be cleaned. The manhole is filled with water and the pressure from this head of water pushes the ball downstream through the sewer, the small quantity of water which crowds between the edges of the ball and the sewer, at high velocity, washing the deposits downstream a head of the ball. The section of sewer running upstream from the manhole should be plugged temporarily to reduce the amount of water needed.—Ivan E. Houk, Denver, Colo.

Effective Method of Cleaning Sewers with the Aid of a Wooden Ball

Sun Bath for Milk Pails

After a milk pail has been emptied and washed, there still remains a thin film of milk on the inside, and this turns into lactic acid, which hastens the souring of milk put in the pail. The film is very thin and the ultraviolet rays of sunlight, says Prof. Gilbert L. Houser, of the university of Iowa, are deadly to the microscopic bodies which produce lactic acid. So, exposing the inside of the pails to the sunlight will enable one to keep milk sweet for several hours longer than if this precaution were not taken.

Drying the Fish Line

Winding a fish line on the reel when wet and storing it away for any length of time is bound to injure it more or less as the strands, whether silk or cotton, will eventually decay from the presence of moisture. A practical little device which overcomes this difficulty is shown in the accompanying illustration. A strip of metal is cut and bent in the manner indicated to clamp around the pole just in front of the reel. Within the jaws of the clamp a folded strip of felt is placed in such a position that a setscrew passing through the clamp also penetrates and holds the felt. In use the clamp is turned

to the upper side of the pole and the line is placed within the jaws. By turning the reel, the line is drawn through the felt, which removes the water. The clamp may be turned down-

ward to be out of the way when casting is being done.—G. E. Hendrickson, Argyle, Wisconsin.

Pouring Lubricant into Grease Cups

In a Washington auto-service station, specializing in oiling and greasing cars, an unusually handy kink for filling the many grease cups and the grease gun, is in use. The workmen keep the grease can on the side of a small stove where the grease is heated to a fluid. It is then an easy matter to pour this into the cups and into the grease gun.

Cutting Wallboard

Cutting wallboard with a hacksaw is a tedious and time-consuming task, and valuable material is not seldom spoiled by tearing

or breaking it. To avoid this, a Wisconsin contractor devised the simple floor knife shown in the drawing, which cuts quickly and always with a clean straight edge. A 4½-ft. length of knife steel, about 2 in. wide, was sharpened and bolted between two equal lengths of angle iron, as shown, the knife-edge protruding about ¾ in. This device was placed upon the floor, and the wallboard cut along the desired line by placing it on the knife and pounding with a rubber-covered mallet.

Improvised Soft Hammer

If a mechanic has no soft hammer, the following suggestion for making his own will be found useful.

Cut out a round piece of sheet copper or lead, and cut in four wings to the shape indicated in the illustration. As the metal is soft and pliable it can readily be bent over the head and shank of the hammer.

The four projecting legs are then fastened around the neck by means of a piece of wire twisted together securely.—M. J. Quoits, Philadelphia, Pa.

A Warming Pan for Your Dark Room

By RICHARD C. TARR

AN efficient and economical warming pan may be easily made from a common deep roasting pan, the total cost of which is about \$1.60. The materials needed are as follows: One black-iron roasting pan (the one pictured measures 9½ by 14 in. inside, and 4 in. deep); one snap switch; one lamp socket, plain wall-type, keyless; one 100-watt lamp, nitrogen or gas-filled (may be smaller if less heat is desired); one attachment plug; 6 to 12 ft. of sadiron double lampcord (preferable to twisted cord, even though its cost is a trifle more, as it is covered with asbestos, and resists heat); two brass bolts, ⅛ by 1 in. for attaching switch to pan; screws and small nails for attaching board to pan and fastening lamp base to board; two or three rubber-tube insulators, or grommets, with nuts for same.

Bore or punch four ⅜-in. holes in one end of the pan for switch, as shown. Two are

socket. The free terminals of the switch and socket are then connected to each other. As the neater arrangement of introducing the cord is through the back of the pan, a ⅜-in. hole is made through the board, so as to hold the cord to one side and prevent it from coming in contact with the lamp. Fasten the board to the pan with screws or nails to maintain the position shown. To the other end of the cord the plug is attached. The lamp, to prevent breakage, should not be screwed into the socket, except to gauge the

Views of Top and Underside of Simple Warming Pan, with Sketch of Connections

for the bolts that fasten the switch to the pan, and the others for the wires. Bolt the switch in place, and make a hole in the opposite end of the pan, large enough to permit a hard-rubber insulator to be fastened, through which to insert the cord. Select a short piece of pine wood, ⅞ by 3½ in., for the lamp base, and saw to fit the pan, as shown. Bore two ¼-in. holes through the center, about 2½ in. apart. Screw the lamp socket between these holes, gauging the proper location, so that it will be about ¼ in. from the pan bottom and clear of a rule placed across the top. Then mark the outline of the socket base on the board, remove the lamp and screw the socket into place. When finished, the lamp should clear the pan itself and also the material upon which it rests. The socket should be about midway between the holes in the board, to permit the ends of the lampcord to pass through and be attached to the terminals of the socket. The wiring is simple. One of the cord wires is led to one side of the switch, the other to one side of the lamp

proper location on the board, until the job is finished.

Should more heat be desired than will generate from a single lamp, another socket and lamp may be readily added. In operation, the pan rests upside down on a sheet of asbestos or corrugated strawboard (cut from an old carton). The air cells in the last-named material prevent the greater part of the heat from blistering or scorching the table upon which it may rest, although two thicknesses should be used over a highly finished or varnished surface. If not sprung in the making, the pan will be light-tight, or nearly so, if for use during development of plates or printing in the photo laboratory. All light may be prevented from escaping if the pan is set on a couple of layers of weather-strip felt, glued to the strawboard, as shown.

The heat produced is steady and penetrating. A 100-watt nitrogen lamp will give a surface heat of 150° F. and more, without trouble. This amount, used intermittently, will keep a pan of developer "up to snuff" in a cool room, or maintain a good heat in a pan of toning solution.

A special print, needed in a hurry, can be dried quickly on a ferrotype tin, with the use of the pan. If not needed in the laboratory for heating purposes, it makes a pretty fair floodlight for taking photos at night, and the writer has used it as such. Also, it has uses in the kitchen.

Handy Straw or Litter Carrier

To carry straw or litter to the poultry house or stable, or wherever it is to be used, cannot be done without scattering some of it along the way unless you have a carrier of some kind. A carrier can be made at little or no cost. Get three 100-lb. bags, such as poultry and chick feed is shipped in. These usually are made of burlap or other heavy cloth, but, if not available, old grain bags will do. Rip the seams apart and sew the edges together to form a large sheet about 6 or 7 ft. square. Hem the edges so that they will not tear or get fringy. At each corner, on both sides, stitch a triangular piece of tough cloth, such as canvas, and also an old harness ring. Get a piece of $\frac{3}{8}$ -in. rope, 7 ft. long, and tie one end to one of the harness rings. Spread the sheet out, put on as much straw as you can easily carry, pass the rope through the remaining three rings and pull up until the corners come together. You can then carry three or four times as much straw as you could with a basket or by the armful and without

spilling it.

vents Scattering Straw

How Rear Part of Old Cab Is Used for Stand

Novel Cab Stands

Instead of disposing of their old car bodies, the Omaha Yellow Cab Co. use them as stations. Only the rear half of the body is used. It is repainted and attached to the wall of a building as shown in the photo. A desk and telephone are installed, and the rear seat gives the operator plenty of room and comfort. These cab stands are unusually attractive and with an electric sign above them can readily be located.—John T. Bartlett, Boulder, Colorado.

Boiler-Front Polish

Application to boilers is the hardest test that paint can be put to, as some parts of the steel and cast iron are only warm and other parts very hot, and most paints will blister and peel off in patches after the boiler has been used for a short time. A boiler should be out of service when it is being painted. For a number of years one plant has used graphite plumbago mixed with water to the consistency of paint, applying it with a brush. After it is dry it is polished with waste or a cloth. Very little rubbing is required and a smooth finish of a blue color will be imparted. This finish remains indefinitely and all that it requires is a dusting. Before the graphite plumbago is applied all the old paint must be scraped off.

Operating Two Drill-Press Spindles Simultaneously
Speeds Up Production

Operating Two Drill Spindles at Once

In many instances the output of a multiple-spindle drill press can be doubled by the simple expedient of coupling up two spindles so that they can be operated as one. The drawing shows the coupling bar and handle used in one shop for this purpose. The device consists of a straight bar drilled at each end to go over the spindle handles, tapped for screws to tighten it in place, and drilled in the center for a drive-fit handle. It will be found that the length of movement on most machines will allow of holes about $\frac{3}{4}$ in. deep. Thus, short through holes can be best drilled in this way, and the set-up will, of course, vary according to the job. Two vises clamped on the table are handy for many pieces, in other cases parallels will keep the work from turning and make for quicker production.

Beauty Clay Aids Babbitting

When bearings are to be babbitted it will be found advantageous to preheat the babbitting mandrel and also the shell to be babbitted from 100 to 250° F. However, a homogeneous bearing is not always obtained in this way. Make a mixture of ladies' beauty clay and water to the consistency of medium lubricating oil, and paint the mandrel with this after it has been heated. This will make a coating about .003 to .004 in. thick, which will draw the moisture from the metal, insuring a solid bearing.

Bracing Fence Corners

Fences can often be kept from sagging by properly bracing the corner posts. A good method of doing this is shown in the drawing. Set the corner post about 3 ft. in the ground and the next post to the same depth and about 8 or 10 ft. from the corner. Wedge a length of 2 by 4-in. wood between these posts, about 6 in. from the top. A heavy rock is to be placed in the position shown, a hole being dug for this purpose. The hole should be about 2 or 3 ft. deep and some solid earth should be left between it and the post. Now take heavy smooth wire or barb wire, loop and twist it securely around the rock so that it cannot be pulled off readily, then drop the rock into the hole, tamping the ground over and around it firmly. Cut a narrow trench in the ground between the rock and the corner post for the brace wire to rest in. The wire should be brought around the second post about 6 in. below the top. Draw the wire tight and staple it well to the second post. After this is done twist the brace wire between the two posts with a pair of pliers or a piece of steel bar; then stretch the horizontal wires. There will

Method of Bracing Corner Posts of Fences to Prevent Sagging

be no appreciable strain on either post as most of the strain is taken by the rock. I placed corner posts in this manner in loose sandy soil 10 years ago, and they are still standing just as straight as they did at first.—Wm. Bathlot, Taos, New Mex.

ⓘ Never leave a machine after using it without cleaning it thoroughly.

Homemade Tools for Small Concrete Jobs

By G. A. LUERS

WHERE there are only occasional calls for a small concrete job, and the amount of work does not seem to justify

made from $\frac{3}{4}$ -in. pipe, will be found a very useful tool, as is also the trowel of the same material with a wooden handle riveted to it. A "sweep level," 5 ft. long, made from a $\frac{3}{4}$ by 6-in. board, preferably oak, meets the need for a tool for leveling off the tops of concrete walks, or for otherwise drawing con-

Tools for the Occasional Concrete Job around the Home or Farm Simply Made from Material to Be Found on the Scrap Pile

any great expenditure for tools, those shown in the accompanying illustration will be found very handy.

The first thing for which one usually has to hunt is a mixing board. It will be found to save time in the end to make a board, as shown in the drawing, and keep it for future jobs. This consists of a shallow box, about 4 ft. square, fitted with a small roller or wheel and two handles, like a wheelbarrow, to facilitate moving the board about, and to aid in carrying the other tools and materials to the job. A mixer or hoe, of heavy sheet iron or steel and provided with a handle

crete rapidly to an even surface. A wooden float, about 12 by 14 in., will work up a wet top surface on the concrete, and may also be used as a mortar board for small jobs. The scoop measure is made from an old bucket, in the manner shown in the illustration. The size of this being immaterial, it may be chosen to suit individual taste and can be made from any suitable article on hand.

Locking Motor-Support Bolts

Some automobiles have front motor-support bolts, which are often difficult to tighten unless the radiator is removed, as it is impossible to place a wrench on the bolt heads, while tightening the nut from below the supporting frame. The idea shown in the illustration remedies this trouble. The bolt heads are drilled with as large a drill as the head will safely accommodate, and after the bolts are in place, a steel bar is inserted in the holes in the heads, the bar having cotter-pin holes outside each bolt

head. The bolts are easily tightened whenever desired as they will not turn and are as easily removed by sliding the locking bar out of the holes in the heads.—Edwin Kilburn, Spring Valley, Minn.

Ducks Keep Ditches Clean

A western farmer has found that the mosslike plants which grow in irrigation canals during the summer months, sometimes to such an extent as to interfere seriously with the flow of irrigation water, can be kept down in the small shallow lateral ditches by ducks. The ducks swim back and forth along the ditches, eating the moss as fast as it grows, thus feeding economically and keeping the ditches open.

This May Be Your Home

Copyright, Architects' Small House Service Bureau

Plan No. 5B22

QUESTIONS regarding home building addressed to this magazine will be answered by The Architects' Small House Service Bureau of the United States, Inc., controlled by the American Institute of Architects and endorsed by the United States Chamber of Commerce. Inclose 10c and self-addressed envelope. Blueprints, specifications and material list for the house shown here may be obtained at nominal cost. Inclose self-addressed stamped envelope for reply. If further information is desired, send 5c and stamped envelope for a 24-page booklet explaining how the Small House Service Bureau functions and showing 12 sample plans. A new booklet, entitled "Fifty Ways to Lower Home Building Costs," illustrated by ten bureau houses actually lived in, and showing how as much as \$1,000 can be saved on a home, may be obtained for 20 cents.

THE bungalow has a host of friends. Its one-floor arrangement appeals to many, as it offers a coziness and a home atmosphere that are most pleasant. Also the elimination of stair climbing is a great factor in its popularity. In considering those things which go to make up a modern bungalow, there are three points to consider—economy of construction, convenience of arrangement, and a well designed exterior.

The design herewith is a true bungalow, for it is complete on one floor. Its fine arrangement of rooms can only be realized after a careful examination of the floor plan. Special attention has been given to such modern conveniences as a built-in tub and towel closet in the bathroom, space for the refrigerator in the rear entry, a niche in the hall for the telephone and a clothes chute to the laundry.

The living room is of good size, with windows on two sides and has a fireplace. The two bedrooms have cross ventilation. There are four clothes closets and two closets for linen.

The plans call for solid brick construction, although a stucco exterior finish could be used if preferred. Red flash brick with white mortar joints was used in the home illustrated here and in the roof occasional shingle courses were doubled.

Home Builders' Questions

Q. What is a fireplace damper? **A.** The connection between the fireplace and the flue is called the throat. This throat may be of masonry or of metal. If of metal, it can be equipped with a hinged plate called the damper. This damper may be moved so as to adjust the size of the throat to conditions of the fire.

Q. What is the difference between a septic tank and a cesspool? **A.** A septic tank is a scientific device made of two tight tanks suitably connected and arranged so that sewage deposited therein will be digested and made unobjectionable when discharged. A cesspool is simply a pit which may or may not have a drain. It is a source of contamination and may be very dangerous.

Q. The walks we put in last month when the weather was bad were not protected properly, and as a result have crumbled and gone to pieces. I paid \$75 for the job. What can I do? **A.** Get the contractor to replace them. If he will not do so, you may threaten suit.

Q. Please advise whether or not it is advisable to decorate a new home when it is built. **A.** Postpone the decoration of the new house until after it has had a chance to season. The walls may settle somewhat, causing minor cracks in the plaster.

These qualities a good saw must have

SPRING and life, hardness, toughness, edge-holding, easy running, fast cutting—all of these qualities your saw should have.

It can have all of these qualities only when the steel is right.

Saw steel must be stronger than the steel beams which support great buildings; and tough as the armor-plate that protects a battleship. It must sharpen to a razor-keen edge. Be hard, like a bank vault's door; springy as the main spring of the finest watch—and polish like a precious metal.

Henry Disston knew that saw steel must have qualities that no other steel had. So he worked out his own Saw Steel, seventy years ago.

Then he tempered and tensioned his blades; tapered them for clearance in the cut, balanced blade and handle to move naturally with the arm—and the world had a saw that cut.

Today's Disston Saw, in your hardware store, is that saw, perfected through the years. Make it your own—and saw clean and straight, fast and easy, for a lifetime.

Telephone line over the Rocky Mountains

The Builders of the Telephone

SPANNING the country, under rivers, across prairies and over mountain ranges, the telephone builders have carried the electric wires of their communication network. Half a century ago the nation's telephone plant was a few hundred feet of wire and two crude instruments. The only builder was Thomas A. Watson, Dr. Bell's assistant.

It was a small beginning, but the work then started will never cease. In 50 years many million miles of wire have been strung, many million telephones have

been installed, and all over the country are buildings with switchboards and the complicated apparatus for connecting each telephone with any other. The telephone's builders have been many and their lives have been rich in romantic adventure and unselfish devotion to the service.

Telephone builders are still extending and rebuilding the telephone plant. A million dollars a day are being expended in the Bell System in construction work to provide for the nation's growing needs.

The Ratchet adds speed

You grip the handle just once, turn it to and fro . . . easy like . . . and a slick "Yankee" ratchet movement drives (or draws) the screw.

YOU have noticed that your first grip on the handle of a screw-driver is usually your best grip.

Have you ever thought how much easier and quicker you could drive a screw, if you could hold that first best grip and just turn to and fro?

That is exactly what the "Yankee" Ratchet Screw-driver lets you do!

No. 10. — Right-hand ratchet, left-hand ratchet, and rigid adjustments. Eight blade lengths: 2, 3, 4, 5, 6, 8, 10, 12 inches.

No. 11. — Same as No. 10, except ratchet shifter moves across the tool instead of in the direction of the blade.

No. 15. — Thumb-turn at base of blade, for starting wobbly screws with thumb and fore-finger while hand steadies driver (see illustration). Six blade lengths: 2, 3, 4, 5, 6, 8 inches: all 3/16 diameter.

A man gets a lot of fun out of working with "Yankee" Tools. It will pay you to write for the "Yankee" Tool Book" as offered in this page. It shows all of these famous tools for boring in wood, drilling in metal, driving screws, and so on. Here are some of them:—

Ratchet Bit Brace
Ratchet Breast Drills
Ratchet Tap Wrenches

Spiral Screw-drivers
Ratchet Hand Drills
Ratchet Chain Drills

Automatic Push Drills
Ratchet Bench Drills
Vises, removable base

Your dealer can supply you. "Yankee" on the tool you buy means utmost in quality, efficiency and durability.

Now—why should anyone row?

Electric Light—Brilliant 6-volt light on tiller handle illuminates motor and boat. Day-light safety for night-time cruising.

ATTACH a new 1926 Champion Evinrude to the stern of your rowboat or canoe—pull the starter rope and you are off in a flash! Quick, easy starting, as sure as your car. All the speed you need to get you where you want to go no matter what the distance. Thrilling, throbbing power to meet all conditions—a tiller sensitive to the slightest touch—straight away—to sweep in graceful circles—or to “heel turn” when needed.

That’s “Evinruding De Luxe”. Red-blooded, he-man sport.

For the first time refinements have been included in outboard motor construction that are only comparable to the conveniences of your car. Electric lighting, dual ignition and ten other features make the new EVINRUDE the most advanced of outboard motors.

*Go to your Evinrude Dealer and ask for demonstration.

Here's where .001" might mean a mile at the finish line

ONE thousandth of an inch, plus or minus, may lose the race. Building a powerful motor-boat racing engine and keeping it tuned to its best performance is the matter of constantly working to thousandths of an inch in fitting and adjusting its multiple parts. The Quality and Utility of Brown & Sharpe Tools recommend them for such work of the highest standard. They aid in determining the exactness of the engine parts and in setting the delicate adjustments. Every place where the all important demand for exactness is encountered—there you will find Brown & Sharpe Tools.

Send for the new No. 30 Small Tool Catalog. Write for your copy today.

The long tapered blades of Thickness Gauge No. 648 help the mechanic in gauging the "inaccessible" places in a motor. This is but one of over 2300 tools in the complete Brown & Sharpe Line.

One Dollar

Like Finding Money

THOUSANDS upon thousands of men buy Topkis and say it is like finding money.

These are men who once paid high prices for underwear.

They wanted fine fabrics. Soft to the touch, yet durable and long wearing.

They wanted a garment cut on generous lines—plenty of freedom for action.

They wanted workmanship: the niceties of finish that add so much to comfort.

Then, at last, they found it all in Topkis—the union suit for One Dollar. Ask your dealer!

TOPKIS BROTHERS COMPANY
Wilmington, Delaware

General Sales Offices:
93 Worth St., at Broadway, N. Y.

Topkis Flatlock Seam, at the waistline, made by nine needles, forms the strongest part of the garment.

AT THE TOP OF UNDERWEAR FAME STANDS THE TOPKIS NAME

Rauland=Lyric=Trio

A remarkable improvement in audio amplification

*New unit perfected by All-American Engineers gives you the
full, pure, natural tone you have always sought*

YOU have always wanted the ideal result in audio amplification—pure, natural tone with good volume. The laboratories of All-American Radio Corporation have developed a new method of audio amplification and now bring to you this long sought ideal result in the—

Rauland=Lyric=Trio

You know the Rauland-Lyric transformer. Its exceptional tone perfection has made it the largest selling quality transformer in the world. The Rauland-Lyric is now used in combination with the new Rauland-Trio (impedance units) to produce the Rauland-Lyric-Trio amplifier—the highest known perfection in three stage audio amplification.

It is well known that any system of amplification using instruments of similar characteristics has inherent disadvantages. Rauland-Lyric-Trio successfully combines the two leading systems—transformer and im-

pedance coupling—coordinated to retain the advantages of both and to eliminate their weaknesses.

This new method consists of a Rauland-Lyric transformer for the first stage, a Rauland-Trio Type R-300 impedance for the second stage, and a Rauland-Trio Type R-310 impedance for the third stage.

Rauland=Trio

This is a triple feature instrument containing an inductance, a capacity and a resistance in one compact impedance unit. Through laboratory tests of utmost precision, absolutely correct balance is maintained between these important factors. You secure full advantage of impedance amplification and overcome the common variance of commercial types of condensers and resistances. Rauland-Lyric-Trio is the last word in audio amplification.

A free book, "Modern Audio Amplification," tells more about this interesting new development. Write for handbook B-90.

ALL-AMERICAN RADIO CORPORATION

"Betcha! F' work 'r tinkering, it has 'em all beat"

"I can remember when we packed seven tools around to do what that Starrett Combination Square does. An' then they didn't do it any better. Mebbe not so good. There's a marking gage, a rule, a square, a miter, a depth gage, height gage, level and plumb, all in that combination an' each of 'em a mighty good tool by itself.

"I dunno's there's any tool I got — barrin' a hammer an' saw — that I use any oftener. I always take it down to camp with me an' it comes in mighty handy when I'm fixing things up. An' around the house — say, I wouldn't be without it. If you haven't one of 'em, go an' get one — quick. Most any hardware dealer will fix you up."

Ask your dealer to show you this Combination Square. Ask us for a free copy of the big Starrett Catalog No. 23 "AP."

Use Starrett Tools

Adventurers *aboy!*

THE stout craft's launched—there's a man-sized lunch under the thwart—and the last Keds-clad member of the crew is aboard. Shove off!

It's because Keds make them light-footed, quick-footed, sure-footed, give real comfort all summer long, that millions of boys the country over wear Keds for boating, hiking, sports and games of all sorts, and every day knocking around. And for the very same reasons, nearly all great athletes wear Keds in their championship games.

Keds soles are full of life and spring—give a sure grip—and are so tough that one pair of Keds will outwear two or three pairs of ordinary "sneakers."

The uppers are made of canvas that is not only light and cool but strong enough to support the ankles. And there's a special Feltex inner-sole to keep your feet cool and comfortable.

For everyday use and for all sports, wear Keds. They come in all popular styles and at prices from \$1.25 to \$4.50.

Keds are made only by the United States Rubber Company. Your dealer has genuine Keds or can get them for you.

Our 1926 Keds Hand-book of Sports contains all kinds of information on games, sports, camping, etc. Sent free if you address Dept. 1470, 1790 Broadway, New York.

THE "SPORTSTER"

A sturdy athletic-trim Keds model—white with black trim or brown with gray trim—both models with gray sole

*Buy separately
or in assortments*

You'll enjoy it all summer—

WHY not make a comfortable porch swing for your veranda? The whole family will enjoy it and you'll be rightly proud that you made it yourself.

With a set of good tools you can learn to make furniture like a porch swing or a table for the summer cottage. You can also do many odd jobs about the home. But good tools are necessary. Stanley Tools are in nearly every carpenter's kit. And Stanley Tools are used in thousands of manual training classes.

You can buy Stanley Tools separately and so gradually make up your own set.

For your convenience there are also sets of Stanley Tools in a wide variety from No. 904 containing 12 Stanley Tools in a sturdy oak chest at \$15, to No. 850 which holds 49 Stanley Tools in a beautiful cabinet, at \$95. And there are assortments of the same good tools in strong cardboard boxes containing simple directions in each for making your own chest. Prices \$5 to \$20.

Ask your hardware dealer to show you the line of Stanley Tools. And send for our Catalogue No. 34 which describes Stanley Tools both separately and in assortments. Address: The Stanley Works, New Britain, Conn.

A New
DAVEN
Discovery!

GLASTOR

THE TRANSPARENT RESISTOR

A DISCOVERY that makes for greater accuracy, for absolute permanence, and for the abolishment of receiver noises.

In Glastor we have entirely eliminated the use of impregnated fibre, paper or similar substances for the resistance unit. We have replaced it with an entirely new Daven discovery —

DAVEN PROCESSED GLASS

The result—a resistor that will carry the highest current known in the field of radio resistances. A resistor whose resistance can be accurately fixed and which *does not change*—even with rough handling. Radio engineers have tested Glastor for resistance—then abused it, shaken it. In testing again, they find the *resistance unchanged*.

Glastor comes in a complete range of resistance, .0025 to 10. megohms. Try it in your own set. You'll notice the difference. Leading Radio Dealers are now selling Glastor.

N. B. Glastor though embodying this vital new principle and though it has cost us thousands of dollars and more than three years of laboratory and field work to develop and perfect, is no higher priced than the old type Daven Resistors.

Own a Typewriter !

**A Bargain You Can't Ignore!
Try It Free, and See!**

GET YOUR typewriter now. A genuine Shipman-Ward rebuilt Underwood is the one you want—the machine you will eventually buy! Everyone needs it; now anyone can afford it. Don't send a cent—but do get our big special offer—our valuable book on typewriters and typewriting—free. You can learn to write on this standard-keyboard machine in one day. A week after the expressman has brought it, you'd feel lost without it. A trial will prove it—and doesn't cost you a penny!

A New Plan

Our rebuilt plan gives you the *best* machine and saves you a *lot* of money.

The Underwood is so famous a make, and No. 5 so popular a model, you'll have to speak up if you want one of the lot we are just completing now!

We rebuild from top to bottom; replace *every single worn part*; each machine is in *sparkling* condition. New typewriters are commonly guaranteed for a year; we guarantee these completely rebuilt Underwoods *five years*. That's our Better-Than-New Guarantee! And we guarantee a big saving in money!

We don't ask for a cent now. Nor any money at all, unless you are completely won by the wonderful writing machine we ship you for an unrestricted 10-day free trial. When you do buy, take advantage of our very liberal scale of monthly payments. A host of our patrons have paid for their typewriters out of money made typing for others. (One woman made a *thousand dollars* at home last year with her Underwood.)

Free Trial Offer

If you know typewriters, you know the perfect work and the ease and speed of an Underwood. If you have never owned a typewriter, start with the finest! You can try this one at our risk. But, the time to act is **NOW**. Don't miss out on this present bargain offer. Don't

4-Wheel Hydraulic Brakes for Your Ford

(2×2=4) on Fords same as on any other car. In other words Quad-BEC Hydraulic Brakes for Fords applied on all four wheels, are doubly as efficient as brakes applied on two wheels only.

Quad-BEC 4-wheel Hydraulic Brakes were designed by experienced Detroit brake engineers.

Quad-BECS operate smoothly and efficiently and provide added safety, convenience, and mental comfort.

Quad-BECS give much better control of your car at any speed, on wet or dry pavement.

Quad-BECS are neat in appearance, and are easily installed in a few hours' time. No cutting or drilling necessary, everything is bolted neatly into place.

Over seventy per cent of all makes of cars are now factory equipped with 4-wheel brakes. You should have them on your car.

In ordering Quad-BEC 4-wheel brakes for your Ford, specify year and model of car, type of wheels, whether wood, disc, or wire. (If wire or disc give name of maker.)

PRICE \$42.00

Heat . . .

packed in little tin pans to fix your punctures permanently . . .

Tin pan containing solid fuel

. . . with raw rubber patch attached to bottom

To make a repair, you clamp one of these little tin pans over the puncture with the Shaler clamp, and light the fuel. The fuel gives just the right amount of heat to vulcanize the patch permanently to the tube. In five minutes, take off the pan and throw it away. That's all. The repair is part of the tube—HEAT VULCANIZED—quicker and easier than any other way of repairing . . . Complete Outfit costs only \$1.50 wherever auto supplies are sold. Slightly higher in Canada and far West.

Don't Make These Mistakes When Buying a Motorcycle!

DON'T get a machine that is too heavy for comfort, safety and ease of handling—or is too light for power, stamina and acceleration. If you want the greatest thrill and the biggest kick out of motorcycling—make sure you get a twin-cylinder machine that is designed strictly for solo riding!

Indian Scout The Ideal Solo Machine

The scout is designed from hub to hub and top to bottom for solo riding! Its perfect balance—its quick, smooth start and lightning-like pick-up make it the ideal solo machine in heavy traffic. For long distance touring, the Scout has all the speed you'll ever be able to use—all the power you'll ever need—all the endurance that can possibly be built into a motorcycle. And yet the upkeep is less than a cent a mile!

Make this test. Look over all the other makes and then try out an Indian Scout. Experience for yourself that sense of absolute security—that luxurious comfort—that amazing twin-cylinder smoothness and flexibility which only Indian Scout riders enjoy. Call on your nearest Indian Dealer today for a free demonstration and you'll get a new appreciation of what real motorcycling thrills are.

SHAVE ELECTRICALLY!

Although all razor manufacturers claim the diagonal stroke gives a perfect shave, it is a fact that the average shaver finds it practically impossible to master this stroke. The Vibro-Shave Electric Safety Razor, due to its electrically vibrating blade, produces the same effect as the diagonal stroke when drawn over the face in the natural way, for it cuts the hair diagonally without the slightest irritation or pain.

Send us \$10.00 today, and we will send you the complete outfit, including face and scalp massage attachments, five blades, cord and plug, attractively boxed. Shipments also made C. O. D. Your money refunded without question within five days if you are not satisfied.

AGENTS

Learn why
thousands of men are flocking to this new
shaving creation

Accept, please, a 10-day tube to try

GENTLEMEN:—Your present shaving soap may be exactly fitted to your needs—or, it may be failing in one of five important ways.

80% of the users of Palmolive Shaving Cream once were wedded to rival preparations. We won them by sending a 10-day tube for trial. May we do as much for you?

5 mistakes corrected

1. *Lather too scanty*—Palmolive Shaving Cream multiplies itself in lather 250 times. A tiny bit—just one-half gram—suffices for a shave.
2. *Slow action*—Palmolive Shaving Cream acts in one minute and that makes a hard beard wax-like, soft.
3. *Dries on face*—The lather of Palmolive Shaving Cream maintains its creamy fullness for ten minutes on the face.
4. *Hairs lie down*—That is due to weak bubbles. Strong bubbles are essential to support the hairs for cutting. Palmolive bubbles are strong... they hold the hairs erect for the razor.
5. *Skin irritations*—The palm and olive oil content of Palmolive Shaving Cream leaves the face in fine condition. Men like the after-effects.

Let us prove this

We ask your permission to prove these things—to send you a tube to try. We have worked hard to excel in a Shaving Cream. We made up and tested 130 formulas before we attained our ideal.

Do us the kindness to mail this coupon, for your sake and for ours.

Puncture Proof with new wonder GALACITE

THE COST per tire is Very Low

in 1 minute

The greatest and most outstanding automotive invention of the past few years—banishes tire trouble forever. This wonderful new scientific discovery repairs a puncture instantly without taking the tire off wheel or rim. Actually makes any tire puncture-proof for life. Guaranteed not to injure tube, valve or tire. On the contrary, it preserves and lengthens the life of both tube and tire, often—

Increasing Tire Mileage from 10,000 to 12,000 Miles.

MAKE THIS TEST Take a hammer and drive as many nails into a tire as you wish, 10-20-100, it makes no difference. GALACITE seals the punctures instantly as soon as they are made. Stops all slow leaks and porous places. Used in all kinds of tires including low pressure Balloon. GALACITE is warranted for one year, but will last indefinitely.

GUARANTEED TO DO ALL WE CLAIM

Don't confuse Galacite with anything else ever intended for the same purpose; it is new and different—a revolutionary invention, the result of years of research and experiment. GALACITE is backed by a Money Back Guarantee. It must make good—or we will. You take no risk.

AGENTS—\$5,000 to \$10,000 a Year

TREMENDOUS PROFITS. Agents and Distributors everywhere to demonstrate and sell to car owners, garages, filling stations. Work all or spare time in your own home town or traveling. GALACITE sells itself. Every customer becomes so enthusiastic that he helps you sell his friends. A revolutionary invention that will make you independent. You can also manufacture and sell Galacite puncture proof inner tubes.

BERRY BROTHERS' "Handy Andy" TOUCH UP BLACK

Here is a high-quality, jet-black automobile finish that produces an effect closely resembling baked enamel and dries dust-free in one hour. The brush is part of the package—always soft, pliable and ready for use. No motorist can afford to be without Berry Brothers' "Touch Up Black" in the convenient and economical "Handy Andy" bottle. It takes only a moment to cover up a rust spot or scratch, and keep a car looking slick and new. Just unscrew the cover and remove the brush. Don't worry about results. Only close scrutiny will betray your work. If your dealer does not have Berry Brothers' "Handy Andy" Touch Up Black, send us his name and \$1 and we will ship directly to you, prepaid, anywhere in the United States or Canada.

Puncture Proof ^{any} TIRE

with new wonder **GALACITE**

THE COST per tire is **Very Low**

in 1 minute

The greatest and most outstanding automotive invention of the past few years—banishes tire trouble forever. This wonderful new scientific discovery repairs a puncture instantly without taking the tire off wheel or rim. Actually makes any tire puncture-proof for life. Guaranteed not to injure tube, valve or tire. On the contrary, it preserves and lengthens the life of both tube and tire, often—

Increasing Tire Mileage from 10,000 to 12,000 Miles.

MAKE THIS TEST Take a hammer and drive as many nails into a tire as you wish, 10-20-100, it makes no difference. GALACITE seals the punctures instantly as soon as they are made. Stops all slow leaks and porous places. Used in all kinds of tires including low pressure Balloon. GALACITE is warranted for one year, but will last indefinitely.

GUARANTEED TO DO ALL WE CLAIM

Don't confuse Galacite with anything else ever intended for the same purpose; it is new and different—a revolutionary invention, the result of years of research and experiment. GALACITE is backed by a Money Back Guarantee. It must make good—or we will. You take no risk.

AGENTS—\$5,000 to \$10,000 a Year

TREMENDOUS PROFITS. Agents and Distributors everywhere to demonstrate and sell to car owners, garages, filling stations. Work all or spare time in your own home town or traveling. GALACITE sells itself. Every customer becomes so enthusiastic that he helps you sell his friends. A revolutionary invention that will make you independent. You can also manufacture and sell Galacite puncture proof inner tubes.

ACT QUICK SEND NO MONEY. Just your name and address will bring complete particulars by return mail. Get this information right now. Test it out. Get started while the territory you want is still open.

Diamonds

Here at 60% of Market Price

Never in three quarters of a century have we offered such amazing bargains. Hundred of money-saving opportunities in latest Diamond Bargain List, equalling those shown here.

Here's why we can offer such remarkable values: This 75 year old firm—rated at over \$1,000,000.00 capital—the largest and oldest diamond banking institution of its kind in the world has made loans on Diamonds, Watches, and other jewels in excess of \$25,000,000.00.

Why Pay Full Prices

Costs Nothing to See

Thousands of unpaid loans. Must sell now. Diamonds, Jewels, Watches and other Gems of unusual qualities—at an entirely different price basis—viz: loan values not market values. At our risk we send you any bargain you wish for absolutely free examination. No red tape. No obligation. Don't buy unless satisfied you can not match the bargain at 60 per cent more. Diamonds of desirable quality at \$125 per carat. Yes, some even lower priced—also, finest gems obtainable at higher per carat—but proportionately low bargain prices. Our bargains have guaranteed loan values also, unlimited exchange privilege at full prices.

Latest List Diamond Loans

Send at once for latest list. Thousands of unpaid loans and other special advantage bargains. Many from big cash deals direct with European diamond cutters. Every gem described in full detail with exact weight, color, quality, etc. Get details of Free Examination offer. No obligation. List is free.

Greatest Auto Touring Tent

Nothing else like it. All the comfort, headroom and cot space of a wall tent without the bother of carrying a long, cumbersome ridge pole.

THE WENZEL POLELESS TOURING TENT

Has no ridge pole. The two self-adjusting levers fitted with coil springs keep the ridge firm. Has guy ropes like a real Army tent. Stands firm when others blow down. Made of genuine mineral-dyed Army Khaki duck—pliable, waterproof, mildew-proof and odorless. Equipped with bobbinet and curtain door and rear window. Detachable floor fits over sod cloth—makes tent insect-proof. Uprights are jointed, seamless steel.

Costs Much Less

Wenzel Poleless Touring Tent costs 20% to 50% less than the unsteady, cumbersome square types which require heavy framework.

Folds Compactly

Entire tent folds into bundle smaller and lighter than any other tent of equal size. Simple to erect.

Easy to Carry

Shoot the Best Gun

The NEW BENJAMIN is the finest air rifle ever made. Unlike all others. Has amazing accuracy—shoots hard and far. It's the original American genuine AIR operated rifle. One to six pump strokes compress air to any desired degree of power. Same force as in air drills and air hammers except you control the shooting force. Never loses force—no springs or levers to get out of order. Makes crack shots quickly, inexpensively. Gives years of delightful recreation with utmost safety. At your dealer's, or sent postpaid for \$5.00.

Shoot 5 Days FREE

We give you five days, ammunition supplied, to test the NEW BENJAMIN. If in this time you don't believe it to be the finest air rifle you've ever seen or used, and if you don't believe it is the one and only air rifle for you, return it, postpaid, and your money will be refunded at once.

The NEW BENJAMIN AIR RIFLE

America's Original Air Rifle

\$5 at your dealer's or sent postpaid direct from factory on FREE Trial as above if dealer does not handle it—write for our wonderful offer.

Get This Book and Details FREE

BENJAMIN AIR RIFLE & MFG. CO.

At the right is a view of my drafting and specification offices where a large staff of experienced experts are in my constant employ. All drawings and specifications are prepared under my personal supervision.

PROTECT YOUR IDEAS

Take the First Step Today

If you have a useful, practical, novel idea for any new article or for an improvement on an old one, you should communicate with a competent Registered Patent Attorney **AT ONCE**. Every year thousands of applications for patents are filed in the U. S. Patent Office. Frequently two or more applications are made for the same or substantially the same idea (even though the inventors may live in different sections of the country and be entirely unknown to one another). In such a case, the burden of proof rests upon the last application filed. Delays of even a few days in filing the application sometimes mean the loss of a patent. So lose no time. Get in touch with me at once by mailing the coupon on the opposite page.

Prompt, Careful, Efficient Service

This large, experienced organization devotes its entire time and attention to patent and trademark cases. Our offices are directly across the street from the U. S. Patent Office. We understand the technicalities of patent law. We know the rules and requirements of the Patent Office. We can proceed in the quickest, safest and best ways in preparing an application for a patent covering your idea. Our success has been built on the strength of careful, efficient, satisfactory service to inventors and trademark owners located in every state in the Union.

Write for these FREE BOOKS

NO CHARGE for Information On How to Proceed!

The booklet shown here contains valuable information relating to patent procedure that every inventor should have. And with it I will also send you my "Record of Invention" form on which you can sketch your idea and establish its date before a witness. Such evidence may later prove valuable to you. Simply mail the coupon and I will send you the booklet, and the "Record of Invention" form, together with detailed information on how to proceed and the costs involved. Do this NOW. No need to lose a minute's time. The coupon will bring you complete information entirely without charge or obligation.

STRICT SECRECY PRESERVED

All communications, sketches, drawings, etc., are held in strictest confidence in strong, steel, fireproof files, which are accessible only to authorized members of my staff. Feel free to write me fully and frankly. Your case will have my personal attention. It is probable that I can help you. Highest references. But FIRST—clip the coupon and get my free book. Do THAT right now.

Triple Service BRAKE BAND LININGS For Fords

Just Out Fully
Guaranteed For One Year

Here's the
longest
wearing
lining
ever
offered
to
Ford
owners.

I've tried them all and I know. That's why I'm placing Triple Service on the market with a year's guarantee behind it. Different, of course. Scientifically built from chemically processed wood instead of the easy-to-burn-out fabric—she's a wonder. Will not burn, unravel or glaze. Permits gradual stopping with surprising smoothness. Affords an unusually powerful "grip" on full pressure. Easily installed—only four holes—and they're already drilled.

SELLS ON SIGHT

Triple Service is absolutely a sales "knock-out" the year 'round—side-line—part time—full time. No lining can compare with it. Positively lasts three times as long. Saves \$7 every four months for new linings. Real sensation. Big profit at \$2 per Set-of-3. Season is here. Act quick.

Free Offer Write—NOW—for full details—Sales-And-Profit-Plan—Special Free Offer. Hurry! Hurry! Claim your territory.

Art J. Benson, Gen. Mgr.

CHICAGO TIRE LUG CO.
158-338 W. 47th Street, CHICAGO, ILL.

Make big money from repair work

\$10

\$25

\$50

Practically every householder spends at least \$10.00 to \$50.00 each year and many spend several times that much on simple repairs that can be made quickly, easily and well with

Smooth-On No. 1

With a can of Smooth-On, you can save this money in your own home — and by doing similar repair work for others, you can make money.

No skill is required to make repairs and the amount of Smooth-On used on any one job seldom costs more than a few cents.

Typical repairs that can be made perfectly with Smooth-On:—

Stopping leaks in steam, water, gas, oil or stove pipes, mending cracks, breaks or leaks in furnaces and boilers, radiators, tanks, sinks, pots and pails, making loose handles tight on umbrellas, knives, hammers, brushes, drawers, etc., tightening loose screws, hooks, locks, door knobs, etc.

On the Automobile:—Making bursted water jackets and pumps good as new, stopping leaks in radiator, hose connections, gas tank and gas, oil and exhaust lines, making a fume-proof joint between exhaust pipe and tonneau heater, tightening loose headlight posts, keeping grease cups, hub caps, and nuts from loosening and falling off, etc.

To get perfect results, write to us for and use the Smooth-On Repair Book. Free if you return the coupon.

Get Smooth-On No. 1 in 7 oz., 1-lb. or 5-lb. tins at any hardware store or if necessary direct from us.

PLAY THIS HAUNTING "JAZZITHA" The one string Hawaiian O Guitar

Have you seen the latest Jazz instrument? Everybody is talking about the curious, unusual "Jazzitha." If you hear it you will want to own one.

The simplest instrument in the world to play. Absolutely no instructions or lessons necessary. Music is written in numbers. The numbers on finger board correspond with Music numerals. "Boy"—what Music! In ten minutes you'll have everybody stepping. If you want your friends to sit up and take notice get yourself a "Jazzitha." Take it wherever you go. You're sure to have the time of your life. Be original—be the first one in your "crowd" to introduce this weird Jazzitha. Play all the latest song hits.

The Jazzitha is made of fine grained hard wood with specially designed metal sound box. Handsomely decorated and beautifully finished in lacquer—19 inches in length—played with bar and pick.

\$1.47
POST PAID

Send No Money

Just your name and address when Jazzitha and sheet music arrive, pay postman only \$1.47 plus a few cents postage.

\$4⁰⁰ "SUPER GAS SAVER" FOR FORDS COSTS YOU ONLY—1¢

"MR. WEEKS," Famous Aviator and Inventor
Wants Users in All Parts of the Country to Introduce This
WONDERFUL INVENTION

60 MILES ON A GALLON

The amazing fact that a Ford can run 60 miles on one gallon of gasoline was recently brought to light through tests conducted by America's foremost engineers, where it was shown that a gallon of gasoline contains sufficient heat units which if properly atomized and mixed with air would give this additional mileage.
It is common for Ford owners to make from 40 to 44 miles per gallon after this marvelous device is attached.

Finds Our Claims Correct I find that your claims for increased mileage are correct and that a big saving is made by your SUPERS.
M. J. VAN LEEUWEN, Mass.

DO NOT SEND ANY MONEY

To introduce this marvelous device—for a limited time—we have arranged a plan whereby anyone can secure one of these SUPER CARBURETORS for only one cent. Just send your name and address and we will mail you full FREE PARTICULARS—and also explain how you can make \$60 to \$150 PER WEEK.

Magic

Learned Easily At Home

Dr.
Harlan
Tarbell
Master of Magic
who has mysti-
fied magicians
as well as lay-
men with his
marvelous magic.

Astonish Your Friends

Gain that magnetic popularity that makes you the center of any crowd. Business and social success is assured the man who can perform mystifying tricks. You can earn big money either on the side or as a professional, as well as being the most popular person in your crowd. Why envy others' skill? You can learn Magic yourself, quick and easy.

Earn \$250 to \$1000 a Month

Even slight-of-hand, generally supposed to require long practice, is NOW made simple to learn. For Dr. Harlan Tarbell, one of the really Great Magicians, has finally opened up the secrets of his profession in a completely illustrated course offered at a merely nominal cost. Through the wonderful Tarbell System you will be able to mystify and entertain your friends with simple tricks taught in your very first lesson. After that Dr. Harlan Tarbell takes you through the entire maze of slight-of-hand, card tricks and elaborate stage diversifications. The apparently superhuman doings of the accomplished magician become as simple as ABC when you just know how.

Mail Coupon for Special Offer

There is a tremendous demand for magic entertainment. Clubs, Lodges, Charity and Social affairs—all will pay high fees to the man who knows Magic. Dr. Harlan Tarbell really gets as high as \$250 for an half hours work right now. Opportunity everywhere to make money aside from your regular occupation. Salesmen find it a tremendous asset. Find out all about this unprecedented opportunity to learn Magic. The coupon brings full details without any obligation. Mail it TODAY.

500 Quarts of Fire Quenching Gas from 1 Quart of Liquid

At last the ideal way to put out fires quick has been discovered. This is a new fire gun that shoots a chemical more than 25 feet without pumping. And this chemical coming in contact with fire creates a gas of more than 500 times the original volume. This gas smothers out fires instantly by shutting off the air. It puts out celluloid, gasoline, kerosene fires that water only makes worse. Absolutely stainless to clothes, harmless to people. Inexpensive. Always ready. Absolutely necessary for cars and homes, farms, garages, factories, schools, etc. Write at once for low price introductory offer to the **Weldon Manufacturing Company**, Dept. 7-H, Grand Rapids, Michigan. Agents or spare-time workers interested in making up to \$25 a day should write immediately for sales plan.—*Adv.*

Heats 7 Rooms at about the Cost of One!

"With the Bulldog Furnace, we find it takes little more coal to heat the whole seven room house than it did to heat one room with a stove using chestnut coal." J. B. Smith, 18 Elm St., Somerville, N. J.

More Heat with Half the Coal

"I had a hot air furnace in our house before I got the Bulldog and our 7-room house was always cold. With the Bulldog it only takes half as much coal and we had weather below zero, and the house was nice and warm in the morning when we got up. We never have the draft on more than a half hour at a time, and it has the place red hot." Jess. T. Conrad, Shamokin, Pa.

If you are even thinking of a pipeless furnace, or any furnace, write for our free catalog. The Bulldog is one furnace you MUST investigate. Comes completely erected. Fits any height of basement and you install it yourself.

No Money Down

The Bulldog is sent for free inspection

Then, if satisfied, you make only small monthly payments at our amazingly low price. Factory connections in both East and West. We ship from nearest point. Don't consider buying any furnace until you find out about the Bulldog. Write at once for our special offer and our free catalog together with the wonderful record of Bulldog success. Mail this coupon today.

"On my Ford 9 times in 10"

"Whenever I have any tightening or adjusting to do on my Ford I find that nine times in ten I do it with the Crescent Tools I have added to my outfit. They are quickest and handiest." This comment of Henry W. Comstock, a Buffalo, N. Y., car owner, is typical of car owners the country over. Ask your hardware or accessory dealer to show you Crescent Tools.

Kerosene or Gasoline 400° HOTTER

A bltorch has just one job—to make intense heat with safety—in shop—in the home—in wind—in cold weather—wherever heat is needed.

Ask for the
MASTER No. 45

TURNER BLOTORCH
Safe as a Candle

By its advanced construction, it gives 400° greater heat with present day low grade gasoline or kerosene. Double valve control insures no clogging or enlarging of orifice. Only one opening into tank, and this above the fuel line—eliminates leaks from numerous soldered connections. These are only 4 of the 11 patented points of superiority.

Ask your hardware man for a Turner Master No. 45 or send direct. You'll find it the best heat machine you ever used. Fearlessly guaranteed.

New Amazing DOUBLE HEAD REVERSIBLE SPARK PLUG Visible Cap Fits Either End

It's
Here
At
Last!

A spark plug for all makes of cars—trucks—tractors—usable at both ends. And this means—double service—2 plugs in 1. Color of spark visible through top of cap tells which cylinders are not working right. To correct, you simply remove cap, reverse Plug, replace cap without detaching sparking wire. "She's a wonder" was the way one car owner expressed his approval. And she is a wonder—no two ways about it. That's why I'm backing Double Head with a positive 2-year guarantee. New construction principles puts my Plug years ahead of the field.

\$100 A WEEK

And more waiting for you as my local agent—if you get started NOW—before your territory is worked. Here's the most sensational spark plug on the market. Car owners wild about it. Absolutely non-competitive. A fast, new, year 'round seller for side line, part time, full time. Big profit and volume sales at price of \$1.

Free Offer Act quick. Write—NOW—today for limited *Introductory* Free Offer and Factory Sales-Plan. Territory going fast.

"What would I do if I lost my job?"

SUPPOSE your employer notified you tomorrow that he didn't need you any longer? Have you any idea where you could get another position?

Don't have this spectre of unemployment hanging over your head forever. Train yourself to do some one thing so well that your services will be in demand. Employers don't discharge such men. They promote them!

Decide today that you are going to get the specialized training you must have if you are ever going to get—and keep—a real job at a real salary. It is easy if you really try.

Right at home, in the odds and ends of spare time that now go to waste, you can prepare for the position you want in the work you like best. For the International Correspondence Schools will train you just as they are training thousands of other men—no matter where you live—no matter what your circumstances or your needs.

At least find out how, by marking and mailing the coupon printed below. There's no cost or obligation, and it takes only a moment of your time, but it may be the means of changing your whole life.

Mail the Coupon Today for Free Booklet

INTERNATIONAL CORRESPONDENCE SCHOOLS
Box 5587-E, Scranton, Penna.

Without cost or obligation, please send me one of your booklets and tell me how I can qualify for the position or in the subject before which I have marked an X:

\$15,000 A YEAR for the RIGHT MAN

If you're a man of punch and steam—not afraid of a big job, or afraid of the hard work it will take to put it across—there's a real position for you with one of the largest manufacturing concerns in this industry. I'm after ten men—ten hard hitting men with executive ability—who can build and operate large units of salesmen in various parts of the country. These positions will mean no less than \$10,000 a year. If you are a man of this caliber, if you are looking for a permanent connection with a well established firm that will pay big money right from the start, get in touch with me immediately. No application can be considered which does not state qualifications, training, and record in full. Fly-by-nights, curiosity bugs, and shifters need not waste their time by writing. All replies will be held strictly confidential. Address Thomas D. Haskett, Vice President and General Sales Manager, Dept. A-7, 208 West Monroe St., Chicago, Illinois.

The FINISH will Make or Mar Your Handicraft

The Johnson Finishes are RIGHT and EASY

IT'S the finish that counts, after all. No matter how skillfully you make home-made furniture, it takes the right kind of finishing to give that professional touch that makes you proud of your craftsmanship.

You will want the new Johnson Book on Wood Finishing. Gives complete instructions for finishing all kinds of woods—hard or soft—old or new. Tells how to stain wood artistically—everything you want to know about wood finishing. It's Free—just use the coupon below.

Stores displaying this sign carry a full line of Johnson's Artistic Wood Finishes. They will gladly give you a Free copy of the Johnson 25c Book on Wood Finishing.

JOHNSON'S WOOD DYE

With Johnson's Wood Dye inexpensive soft Woods such as pine, cypress, fir, birch, etc., can be finished so they are as beautiful and artistic as expensive hard woods. Comes in oil and spirit in 17 beautiful shades, among the most popular of which are:

No. 131—Walnut	No. 126—Light Oak
No. 123—Dark Oak	No. 124—Golden Oak
No. 127—Brown Mahogany	No. 129—Dark Mahogany

Johnson's Wood Dye is easy to apply. It goes on smoothly and will not rub off or smudge. Penetrates deeply, bringing out the beauty of the grain. Dries ready for the finish coat in four hours.

500 Punctures Without Loss of Air

**OVER
1,000,000
SOLD**

I'LL PAY YOU BIG MONEY
To Demonstrate My Guaranteed
MILBURN PUNCTURE-PROOF TUBES

20,000,000 CAR OWNERS

Are waiting for my amazing long-life, no trouble, air-filled, puncture-proof inner-tube—the *only* tube to successfully withstand the 500-nail-hole-plank-test without loss of air.

Costs no more than the ordinary tube and is sold under a *positive, money-back guarantee.*

WARNING
I am the originator of the air-filled puncture-proof tube. Beware of imitators. I have no other connection with any "so-called" puncture proof tube. —M. E. Milburn.

MAKES MOTORING A PLEASURE—DOUBLES TIRE MILEAGE

Users of *Milburn Puncture-Proof Tubes* everywhere are enjoying the easy riding performance of the air-filled tube *without the annoyance of punctures and slow leaks.* And a tire mileage increase from 12,000 to 15,000 miles. Many users report 30,000 miles (double mileage) without removing a tire from the wheel.

MONEY BACK GUARANTEE

We hereby agree to refund to *any purchaser* the full amount paid for any *Milburn Puncture-Proof Tube* that leaks air when punctured by anything not larger than a twenty-penny spike. We also *guarantee* that casings will last much longer and give *much greater mileage* where *Milburn Puncture-Proof Tubes* are used. Milburn Puncture-Proof Tube Co., Inc.

PROOF

J. D. Cooper—"I have made 50,000 miles with my Milburn Puncture-Proof Tube and have not as yet removed a rim or casing and my casings are in excellent condition."
J. T. Berdahl—"Have been using Milburn Tube since 1922, driving every day. Have pulled out any number of nails without loss of air."
A. C. Winsley—"I have driven 500 nails in one of my Milburn Puncture-Proof Tubes without loss of air."
J. S. MacElroy—"Received the shipment of 500 Milburn Puncture-Proof Tubes and find them as represented. Hope to send you another 500 tube order soon."
W. H. Rodman—"I wish to praise your Milburn Puncture-Proof Tubes. They can't be beat. I drove 15 nails in one tube and I haven't put any air in it since. Everyone is wild over your tubes."

TEST THE MILBURN AT MY RISK

You'll be delighted. And you'll realize how easily orders are secured. Sales experience is not necessary to coin money selling the *Milburn. Positively the biggest tube value obtainable.* Absolutely non-competitive. I control all basic patents. Car owners buy on demonstration. It makes no difference what tires they use or what car they drive.

\$178.56 IN 6 DAYS

That's what A. Murphy made the first six days out with Milburn Puncture-Proof Tubes.

\$14.04 in 10 Minutes

"I made \$14.04 in ten minutes with your tubes."—Chas. Clayton.

\$58.50 in 3 Days

"The first three days out selling your tubes I cleaned up \$58.50."—L. C. Jervis.
